ABSTRACT. — We consider smooth solutions, $\mathcal{U}$, to the nonlinear elliptic system associated with a two dimensional elastic material which has energy functional

$$\mathcal{W} (\mathcal{U}) = \int_{\Omega} \left( \frac{|D\mathcal{U}|^2}{2} + H(\det D\mathcal{U}) \right) dX.$$ 

The function $H(d)$ is nonnegative, convex and unbounded in a neighborhood of zero. Two maximum principles are proved for $D\mathcal{U}$ and we show that if $\Omega' \subseteq \Omega$ then $\|D\mathcal{U}\|_{C^{\alpha}(\Omega')}$ and $\|D\mathcal{U}^{-1}\|_{L^\infty(\Omega')}$ are bounded a priori in terms of $\|D\mathcal{U}\|_{L^p(\Omega)}$ and $\mathcal{W} (\mathcal{U})$ for some $p = p (H)$.

RÉSUMÉ. — On considère une solution régulière $\mathcal{U}$ du système elliptique non linéaire associé à la fonctionnelle d'énergie

$$\mathcal{W}(\mathcal{U}) = \int_{\Omega} \left( \frac{|D\mathcal{U}|^2}{2} + H(\det D\mathcal{U}) \right) dX$$

en dimension 2, la fonction $H$ étant positive, convexe, et $H(t) \to +\infty$ quand $t \to 0^+$. On démontre deux principes du maximum et une estimation de $D\mathcal{U}$ à l'intérieur de $\Omega$.

1. INTRODUCTION

In this paper we derive several a priori estimates for classical solutions of certain problems in two-dimensional compressible nonlinear elasticity.

We consider a two-dimensional elastic body occupying a reference configuration $\Omega$ in $\mathbb{R}^2$ where $\Omega$ is an open bounded set with smooth boundary. We define a smooth deformation of the body as a diffeomorphism,

$$\mathcal{U}(x, y) = (u(x, y), v(x, y)) \quad \text{for} \quad (x, y) \in \Omega$$

which satisfies $\mathcal{U} \in C^3(\Omega; \mathbb{R}^2) \cap C^1(\overline{\Omega}, \mathbb{R}^2)$ with $\det D\mathcal{U} = u_x v_y - u_y v_x > 0$ in $\Omega$. We assume that the body is composed of a compressible neo-Hookean material. Its mechanical properties are then described by a stored energy function of the form

$$\sigma(F) = \frac{|F|^2}{2} + H(\det F)$$

for $F \in \mathbb{M}^{2 \times 2}_+ \equiv \{ 2 \times 2 \text{ real matrices with } \det F > 0 \}$. The function $H$ is assumed to satisfy the following hypotheses:

1. $H \in C^3((0, \infty))$
2. $H \geq 0$ and $H'' > 0$
3. For some positive constants $s$, $c_1$, $c_2$, and $d_0$,

$$c_1 t^{-s-k} \leq (-1)^k \frac{d^k}{dt^k} H(t) \leq c_2 t^{-s-k} \quad \text{for} \quad 0 < t < d_0$$

and $k = 0, 1, 2, 3$.
4. For some constant $\tau$ and positive constants $c_3$, $c_4$, and $d_1$,

$$c_3 \tau^2 \leq \frac{d^2}{dt^2} H(t) \leq c_4 \tau^2 \quad \text{for} \quad t \geq d_1.$$
Assumption 3 implies that $H(t)$ is proportional to $t^{-s}$ as $t \to 0^+$. Thus $\sigma$ satisfies the growth condition

$$\sigma(F) \to \infty \quad \text{as} \quad \det F \to 0^+.$$  

This condition expresses the notion that it takes an infinite amount of energy to extend or compress a finite volume of material into zero volume. (See [1] for a detailed discussion of this condition.)

Under a smooth deformation, a point $X$ in $\Omega$ is displaced to a point $\mathcal{U}(X)$. The total stored energy (neglecting body forces) is given by

$$\mathcal{W}(\mathcal{U}) = \int_{\Omega} \sigma(D\mathcal{U}) \, dX$$

where $D\mathcal{U}$ denotes the gradient of $\mathcal{U}$. By our assumptions on $\mathcal{U}$, it follows that $\mathcal{U} + \varepsilon \Phi$ is also a smooth deformation for any $\Phi \in C^\infty_0(\Omega; \mathbb{R}^2)$ and $\varepsilon$ sufficiently small. Thus one can compute the first variation of $\mathcal{W}$ at $\mathcal{U}$:

$$\frac{d}{d\varepsilon} \mathcal{W}(\mathcal{U} + \varepsilon \Phi) \bigg|_{\varepsilon = 0} = \int_{\Omega} \frac{\partial \sigma}{\partial F_{ij}} (D\mathcal{U}) \Phi_{ij} \, dX.$$  

A classical equilibrium solution is defined to be a smooth deformation $\mathcal{U}$ whose first variation is zero. This gives the Euler-Lagrange equations

$$\sum_{j=1}^2 \frac{\partial}{\partial x_j} \left( \frac{\partial \sigma}{\partial F_{ij}} (D\mathcal{U} (X)) \right) = 0 \quad \text{for} \quad i, j = 1, 2.$$  

For $\sigma$ as in (1.1) we obtain the system

$$\begin{cases} \Delta u + v_y, \ H'(d)_x - v_x, \ H'(d)_y = 0 \\ \Delta v - u_y, \ H'(d)_x + u_x, \ H'(d)_y = 0 \end{cases} \quad \text{for} \ (x, y) \in \Omega$$

where $d = \det D\mathcal{U} = u_x v_y - u_y v_x$. This system is elliptic since the strict Legendre-Hadamard condition

$$\sum_{i, j, k, l=1}^2 \frac{\partial^2 \sigma}{\partial F_{ij} \partial F_{kl}} (F) \lambda_i \lambda_k \pi_j \pi_l \geq |\lambda|^2 |\pi|^2$$

holds for all $\lambda, \pi \in \mathbb{R}^2$ and all $F \in M^2_{+ \times 2}$. The ellipticity is not uniform, however, since $D^2 \sigma$ becomes singular at the boundary of $M^2_{+ \times 2}$, i.e.,

$$\sup_{|\lambda| + |\pi| = 1} \left( \sum_{i, j, k, l=1}^2 \frac{\partial^2 \sigma (F)}{\partial F_{ij} \partial F_{kl}} \lambda_i \lambda_k \pi_j \pi_l \right) \geq 1 + \frac{|F|^2}{2} \cdot H''(\det F)$$

and the corresponding infimum is equal to 1 for all $F$ in $M^2_{+ \times 2}$.

Significant progress has been made in finding deformations that solve elliptic boundary value problems for stored energy functions $\gamma$ whose structure is compatible with compressible nonlinear elasticity theory. Here $\gamma$ has two important properties: first, it has the singular behavior described...
in (1.3) and second, it is frame-indifferent; that is, a rotation following a deformation leaves \( \gamma \) unchanged, so that

\[(1.6) \quad \gamma(QF) = \gamma(F) \quad \text{for all } Q \in \text{SO}(2).\]

A class of functions which permits these properties is that of polyconvex functions defined by Ball [1]. Ball and Murat have shown (see [1] and [3]) that if \( \gamma \) is polyconvex and satisfies certain growth conditions, there exists a minimizer of \( \int_{\Omega} \gamma(D\mathcal{U}) \, dX \) among all functions \( \mathcal{U} \) in \( W^{1,2}(\Omega; \mathbb{R}^2) \) satisfying \( \det D\mathcal{U} > 0 \) almost everywhere and taking on prescribed boundary values. (See Giaquinta, Modica and Soucek [7] for an alternative approach to such problems.) The function \( \sigma \) of (1.1) is polyconvex and satisfies (1.6). Moreover, Ball and Murat's existence theorems apply to

\[W^r(\mathcal{U}) = \int_{\Omega} \sigma(D\mathcal{U}) \, dX.\]

However, there are no regularity results to show that the minimizer lies in a smoother class of functions or that it is in fact a weak solution to the Euler-Lagrange equations.

The regularity theory for elliptic variational problems in two space dimensions is developed mainly in the case where \( \gamma \) is defined and finite-valued at all \( F \in M^{2 \times 2} = \{ 2 \times 2 \text{ real matrices} \} \) and \( \gamma \) is convex. For instance if \( \gamma \) is \( C^2 \), \( D^2 \gamma \) is uniformly positive definite and \( |D^2 \gamma| \) is bounded, then it is known that any minimizer has Hölder continuous first derivatives in \( \Omega \). (See [6].) From this point, linear elliptic theory implies that \( \mathcal{U} \) is as smooth as \( \gamma \) allows; e. g., if \( \gamma \) is \( C^{k,\alpha} \), then the minimizer is \( C^{k,\alpha} \) for \( k \geq 2 \) and \( 0 < \alpha < 1 \). For the same problem in \( n \) space dimensions where \( n \geq 3 \) there are partial regularity results, i. e., any minimizer is smooth on an open subset \( \Omega_0 \) of \( \Omega \) with \( \mathcal{H}^p(\Omega \setminus \Omega_0) = 0 \) for some \( p < n-2 \). The condition that \( \gamma \) be convex is too restrictive for elasticity since it is not compatible with the principle of frame indiindifference (1.6). In fact, for \( \sigma \) as in (1.1), \( D^2 \sigma \) is not positive definite on \( M^{2 \times 2}_+ \).

In recent work of Evans [4] (see also Evans and Gariepy [5]), the convexity of \( \gamma \) is replaced by a weaker condition related to polyconvexity and a partial regularity result is obtained. However, it is required that \( \gamma \) be continuous and finite-valued on \( M^{2 \times 2} \) which rules out the singular behavior of \( \sigma \) in (1.3).

In all the works cited above where \( \gamma \) is locally bounded the main idea is to estimate the gradient of the solution, namely \( D\mathcal{U} \). On the other hand for solutions related to \( \sigma \) as in (1.1) one must simultaneously estimate \( D\mathcal{U} \) and \( (D\mathcal{U})^{-1} \). Our investigation shows that the special structure of \( \sigma \) allows one to deduce such bounds. As a result, we are able to get \textit{a priori} estimates on classical equilibrium solutions of (1.4). In particular, we
show that if $\Omega' \subset \Omega$ then

$$\left\| \frac{1}{|\det D\mathcal{U}|} \right\|_{L^\infty(\Omega')} \leq c \quad \text{and} \quad \|D\mathcal{U}\|_{C^\alpha(\partial\Omega)} \leq c$$

where $c$ and $\alpha$ depend only on $\Omega$, $\Omega'$, $H$, $\mathcal{W}(\mathcal{U})$, and $\|D\mathcal{U}\|_{L^p(\Omega)}$ for some $p = p(H)$ with $2 < p < \infty$. (See Theorems 4.2 and 5.2) Moreover, we show that the functions, $d \equiv \det D\mathcal{U}$ and $z \equiv \left| D\mathcal{U} \right|^2 + f(\det D\mathcal{U})$, where $f(d) = dH'(d) - H(d)$, are super and sub-solutions, respectively, for certain elliptic equations. As a result, they satisfy classical maximum principles in $\Omega$.

It is our hope that the estimates presented here will help to produce a regularity theory for minimizers of $\mathcal{W}(\mathcal{U})$ or aid in establishing the existence of classical equilibrium solutions by a different approach.

Our paper is organized as follows. Assume $\mathcal{U}$ is a classical equilibrium solution in $\Omega$ and let $d = \det D\mathcal{U}$. In Section 2 we show that higher integrability of $d^{-s}$ can be obtained from higher integrability of $|D\mathcal{U}|^2$. Recall that $H(d) \sim d^{-s}$ for $d$ near zero and hence

$$\|d^{-s}\|_{L^1(\Omega)} \leq c \cdot (1 + \mathcal{W}(\mathcal{U})).$$

For any $p$ with $1 < p < \infty$ and $\Omega' \subset \subset \Omega$, we prove that

$$\|d^{-s}\|_{L^p(\Omega')} \leq c_1(H, \Omega') \cdot (1 + \|f(d)\|_{L^p(\Omega')} \leq c_2(H, p, \Omega, \Omega') \cdot (1 + \mathcal{W}(\mathcal{U}) + \|\|D\mathcal{U}\|^2\|_{L^p(\Omega)}).$$

(See Corollary 2.3.)

In section 3 we prove maximum principles which give global bounds on $|D\mathcal{U}|$ and $|D^{-1}\mathcal{U}|$. Let $v_1(X)$ and $v_2(X)$ be the singular values of $D\mathcal{U}$ at $X$, i.e., the eigenvalues of $[D\mathcal{U}(D\mathcal{U})^T]^{1/2}$ with $0 < v_1 \leq v_2 < \infty$. We have

$$|D\mathcal{U}| = (v_1^2 + v_2^2)^{1/2} \quad \text{and} \quad |(D\mathcal{U})^{-1}| = \left(\frac{1}{v_1^2} + \frac{1}{v_2^2}\right)^{1/2}.$$  

Thus it suffices to bound $\left(\frac{1}{v_1(X)} + v_2(X)\right)$. We show that the functions $d(X)$ and $z(X) = \left| D\mathcal{U} \right|^2 + f(d)$, where $f(d) = dH'(d) - H(d)$, satisfy super and subelliptic inequalities, respectively. (See Theorems 3.2 and 3.6.) Thus

$$\inf_{\Omega} d \geq \inf_{\partial\Omega} d$$

and

$$\sup_{\Omega} z \leq \sup_{\partial\Omega} z.$$
From our hypotheses on $H$ it follows that

$$\sup_{\Omega} \left( \frac{1}{v_1} + v_2 \right) \leq c \left( \inf_{\partial \Omega} d, \sup_{\partial \Omega} z \right).$$

In section 4 we prove interior estimates. Let $\Omega' \subset \subset \Omega'' \subset \subset \Omega$ and let $p = \max \left\{ 16, 12 + \frac{16}{s} \right\}$. Then

$$\sup_{\Omega'} \frac{1}{d} \leq c(\Omega', \Omega''), \| f (d) \|_{L^{p/2}(\Omega'')}, \| D\mathcal{U} \|_{L^p(\Omega')},$$

and

$$\sup_{\Omega'} \| z \| \leq c(\Omega', \Omega''), \| f (d) \|_{L^{p/2}(\Omega'')}, \| D\mathcal{U} \|_{L^p(\Omega')}. \tag{1.9}$$

(See Theorems 4.2 and 4.4.) It follows from (1.7) that

$$\sup_{\Omega'} \left( \frac{1}{v_1} + v_2 \right) \leq c(\Omega, \Omega', \Omega'', H, \mathcal{W}(\mathcal{U}), \| D\mathcal{U} \|_{L^p(\Omega)}). \tag{1.9}$$

(See Theorem 4.5.)

Finally in section 5 we prove a Hölder estimate of $D\mathcal{U}$ depending only on $\beta_1 = \inf_{\Omega} v_1$ and $\beta_2 = \sup_{\Omega} v_2$. Since the system (1.4) is elliptic this is the estimate needed to get higher order ($C^{\alpha, \beta}$) interior estimates. We prove the following Caccioppoli inequality on $\Omega$

There exists a constant $c_1(\beta_1, \beta_2)$ so that for any ball $B_{2r}(X_0) \subset \Omega$ we have

$$\int_{B_r(X_0)} |D^2 \mathcal{U}|^2 \, dX \leq \frac{c_1}{r^2} \int_{B_{2r}(X_0)} |D\mathcal{U} - \overline{D\mathcal{U}_{X_0, 2r}}|^2 \, dX,$$

where $\overline{D\mathcal{U}_{X_0, 2r}} = \frac{1}{B_{2r}(X_0)} \int_{B_{2r}(X_0)} D\mathcal{U} \, dX$. (See Lemma 5.1.) It then follows from (1.9) and elliptic theory that

$$\| D\mathcal{U} \|_{C^\alpha(\Omega)} \leq c_2$$

for some $\alpha > 0$ where $\alpha$ and $c_2$ depend only on $\Omega, \Omega', H, \mathcal{W}(\mathcal{U})$, and $\| D\mathcal{U} \|_{L^p(\Omega)}$. (See Theorem 5.2.) From this and elliptic theory we obtain

$$\| \mathcal{U} \|_{C^{\alpha, \beta}(\Omega)} \leq c_3$$

for any $k \geq 2$ and $0 < \beta < 1$ such that $H \in C^{k, \beta}_{\log}(\mathbb{R}^n)$ where $c_3$ depends only on $k, \beta, \Omega, \Omega', H, \mathcal{W}(\mathcal{U}), \| \mathcal{U} \|_{L^2(\Omega)}$ and $\| D\mathcal{U} \|_{L^p(\Omega)}$. (See Theorem 5.4.)
In this section we show that if \( U \) is a classical equilibrium solution, the \( L^p_{loc} \) norm of \( d^{-2} = \det D^2 U \) is bounded \textit{a priori} by the energy \( W(U) \) and the \( L^p \)-norm of \( |D^2 U|^2 \). (See Corollary 2.3.) To prove this we use the following system of partial differential equations which is equivalent to (1.4):

\[
\begin{align*}
\begin{cases}
u \Delta u + v_x \Delta v + d \cdot H'(d)_x = 0, \\
u_x \Delta u + v_y \Delta v + d \cdot H'(d)_y = 0.
\end{cases}
\end{align*}
\]

The first equation above is the sum of the equations obtained by multiplying (1.4)_1 by \( u_x \) and (1.4)_2 by \( v_x \). The second equation is the sum of the equations obtained by multiplying (1.4)_1 by \( u_y \) and (1.4)_2 by \( u_y \).

Define \( f(d) = d \cdot H'(d) - H(d) \) and note that \( f'(d) = d \cdot H''(d) \). Let \( z = z(X) \equiv \frac{1}{2} |D^2 U|^2 + f(d) \). From (2.1) we deduce:

**Lemma 2.1.** Assume \( U \) is a classical equilibrium solution. Then

\[
\Delta z = 2(u_{xy} - u_{xx} \cdot u_{yy}) + 2(v_{xy} - v_{xx} \cdot v_{yy}).
\]

**Proof.** Differentiating (2.1)_1 with respect to \( x \), (2.1)_2 with respect to \( y \), and adding, we obtain

\[
\begin{align*}
0 &= \left\{ (u_x \Delta u)_x + (v_x \Delta v)_x + (u_y \Delta u)_y + (v_y \Delta v)_y \right\} \\
&+ [d \cdot H'(d)_x]_x + [d \cdot H'(d)_y]_y - (u_x \Delta u_x + v_x \Delta v_x + u_y \Delta u_y + v_y \Delta v_y) \\
&+ (u_{xx} \Delta u + v_{xx} \Delta v + u_{yy} \Delta u + v_{yy} \Delta v) + \Delta f(d).
\end{align*}
\]

Now

\[
\Delta z = \frac{1}{2} \Delta (u_x^2 + v_x^2 + u_y^2 + v_y^2 + \Delta f(d))
\]

\[
= (u_x \Delta u_x + v_x \Delta v_x + u_y \Delta u_y + v_y \Delta v_y)
+ (|\nabla u_x|^2 + |\nabla v_x|^2 + |\nabla u_y|^2 + |\nabla v_y|^2) + \Delta f(d).
\]

Combining this with (2.2) we have

\[
\Delta z = -(u_{xx} \Delta u + v_{xx} \Delta v + u_{yy} \Delta u + v_{yy} \Delta v)
+ (|\nabla u_x|^2 + |\nabla v_x|^2 + |\nabla u_y|^2 + |\nabla v_y|^2)
= 2(u_{xy}^2 - u_{xx} \cdot u_{yy}) + 2(v_{xy}^2 - v_{xx} \cdot v_{yy}).
\]

We are now in a position to prove:

**Theorem 2.2.** Assume \( U \) is a classical equilibrium solution and \( B_{3\alpha} = B_{3\alpha}(X_0) \subset \Omega \). For any \( p \) in \((1, \infty)\),

\[
\| f(d) \|_{L^p(B_{3\alpha})} \leq c_1 \cdot (1 + \|D^2 U\|^2 + H(d)) \|_{L^1(B_{3\alpha})} + \|D^2 U\|^2 \|_{L^p(B_{3\alpha})}
\]

\[
\leq c_2 \cdot (1 + W(U)) + \|D^2 U\|^2 \|_{L^p(B_{3\alpha})}
\]

where \( c_1 \) and \( c_2 \) are constants depending only on \( r, p, \) and \( H \).

**Proof.** — By direct calculation,

\[
2(u^2_{xx} - u_{x}, u_{yy}) + 2(v^2_{xy} - v_{xx}, v_{yy}) = (u^2_x + v^2_x)_{yy} - 2(u_x u_y + v_x v_y)_{xy} + (u^2_y + v^2_y)_{xx}
\]

for any \( C^3 \)-functions, \( u \) and \( v \). Combining this with Lemma 2.1, we obtain:

\[
(2.3) \quad \Delta f(d) = \sum_{i, j=1}^{2} (e_{ij})_{x_i x_j}
\]

where \( X = (x, y) = (x_1, x_2) \) and \( |e_{ij}| \leq \|D^2 \eta\|_r^2 \) for \( 1 \leq i, j \leq 2 \).

Now choose \( \eta \in C^\infty_\varepsilon(B_{3r}) \) with \( 0 \leq \eta \leq 1 \), \( \eta = 1 \) on \( B_{2r} \), \( |\nabla \eta| \leq \frac{c}{r} \), and

\[
|D^2 \eta| \leq \frac{c}{r^2}
\]

where \( c \) is independent of \( r \). Let \( g \in C^\infty_c(B_r) \) and set

\[
w(X) = \frac{1}{2\pi} \cdot \int_{B_r} \log |X - Z| \cdot g(Z) dZ.
\]

Then

\[
(2.4) \quad \int_{B_r} f(d) \cdot g dX = \int_{\mathbb{R}^2} f(d) \cdot \eta \cdot \Delta w dX
\]

\[
= -\int_{B_{3r} - B_{2r}} f(d) \cdot w \cdot \Delta \eta dX - 2\int_{B_{3r} - B_{2r}} f(d) \cdot \langle \nabla w, \nabla \eta \rangle dX
\]

\[
+ \int_{B_{3r}} \left\{ \sum_{i, j=1}^{2} e_{ij} \cdot (\eta w)_{x_i x_j} \right\} dX
\]

\[
= \int_{B_{3r} - B_{2r}} \left\{ -f(d) \cdot w \cdot \Delta \eta - 2f(d) \cdot \langle \nabla w, \nabla \eta \rangle \right.\]

\[
+ \sum_{i, j=1}^{2} e_{ij} \cdot (w \cdot \eta_{x_i x_j} + w_{x_i} \eta_{x_j} + w_{x_j} \eta_{x_i}) \right\} dX
\]

\[
+ \int_{B_{3r}} \eta \cdot \sum_{i, j=1}^{2} e_{ij} \cdot w_{x_i x_j} dX \equiv I + II.
\]

By Hölder’s inequality and the definition of \( w \),

\[
|w| + |\nabla w| \leq c_1(r, p) \cdot \|g\|_{L^q(B_r)} \quad \text{in} \quad B_{3r} - B_{2r}
\]

where \( \frac{1}{p} + \frac{1}{q} = 1 \). Hence

\[
|I| \leq c_2(r, p) \cdot \left\{ \|f(d)\|_{L^1(B_{3r})} + \sum_{i, j=1}^{2} \|e_{ij}\|_{L^1(B_{3r})} \right\} \cdot \|g\|_{L^q(B_r)}.
\]
From our hypotheses on $H$ [See (1.2)], we have
$$|f(d)| \leq |H(d)| + |d, H'(d)| \leq M_1 + M_2 + M_3 \cdot |H(d)|$$
for $d > 0$. Since $d \leq |D\mathcal{U}|^2$ and $|e_{ij}| \leq |D\mathcal{U}|^2$, it follows that
$$|1| \leq c_3 \cdot \|1 + |D\mathcal{U}|^2 + H(d)\|_{L^1(B_{3r})} \cdot \|g\|_{L^q(B_r)}$$
where $c_3$ depends on $r, p, H$.

To estimate $\Pi$, we note that by the Calderon-Zygmund inequality,
$$\|D^2 w\|_{L^q(\mathbb{R}^2)} \leq c_4 \cdot \|g\|_{L^q(B_r)}$$
and hence
$$|\Pi| \leq \|\eta\|_{L^\infty(B_{3r})} \cdot \sum_{i, j = 1}^{2} \|e_{ij}\|_{L^p(B_{3r})} \cdot \|D^2 w\|_{L^q(\mathbb{R}^2)} \leq c_5 \cdot \|D\mathcal{U}|^2\|_{L^p(B_{3r})} \cdot \|g\|_{L^q(B_r)}$$
where $c_4$ and $c_5$ depend only on $p$.

By (2.4), (2.5), and (2.6), we have
$$\int_{B_r} f(d) \cdot g \, dX \leq c_1 \cdot (r, p, H) \times \left( \|1 + |D\mathcal{U}|^2 + H(d)\|_{L^1(B_{3r})} + \|D\mathcal{U}|^2\|_{L^p(B_{3r})} \right) \cdot \|g\|_{L^q(B_r)} \leq c_2 \cdot (r, p, H) \cdot (1 + \mathcal{W}(\mathcal{U}) + \|D\mathcal{U}|^2\|_{L^p(B_{3r})}) \cdot \|g\|_{L^q(B_r)}$$
and the theorem follows.

Our hypothesis (1.2) implies that
$$d^{-s} \leq c \cdot |f(d)| \quad \text{for} \quad 0 < d \leq d_0.$$ Indeed on this interval $H'(d) < 0$ so by (1.2)_3
$$d^{-s} \leq c \cdot H(d) \leq c \cdot |dH'(d) - H(d)| = c \cdot |f(d)|.$$

From this and Theorem 2.2 we have:

**Corollary 2.3.** Assume $\mathcal{U}$ is a classical equilibrium solution and $\Omega' \subset \subset \Omega$. If $1 < p < \infty$, then
$$\|d^{-s}\|_{L^p(\Omega')} \leq c_1 \cdot (1 + \mathcal{W}(\mathcal{U})) \leq c_2 \cdot (1 + \mathcal{W}(\mathcal{U})) + \|D\mathcal{U}|^2\|_{L^p(\Omega')}$$
where $c_1$ and $c_2$ depend on $\Omega, \Omega', H$, and $p$.

Our proof of Theorem 2.2 used duality and hence it requires only that $\mathcal{U}$ satisfy (2.3) in the sense of distributions. As a result, Theorem 2.2 can be extended to a weaker class of equilibrium solutions. We conclude this section by defining the notion of weak equilibrium solutions (due to Ball) and showing that Theorem 2.2 holds for such solutions.
Our definition is based on the following two results:

**Theorem 2.4 (See Ball and Murat [3].)** Let
\[ \mathcal{A} = \{ \mathcal{U} \in W^{1,2}(\Omega; \mathbb{R}^2) : \det D\mathcal{U} > 0 \text{ a.e. in } \Omega \text{ and } \mathcal{W}''(\mathcal{U}) < +\infty \}. \]

Suppose \( \mathcal{U}_0 \in \mathcal{A} \) and set
\[ \mathcal{A}(\mathcal{U}_0) = \{ \mathcal{U} \in \mathcal{A} : \mathcal{U} - \mathcal{U}_0 \in W^{1,2}_0(\Omega; \mathbb{R}^2) \}. \]

Then \( \mathcal{W}''(\mathcal{U}) \) attains its minimum in \( \mathcal{A}(\mathcal{U}_0) \).

The minimizer of \( \mathcal{W}''(\mathcal{U}_0) \) satisfies a system of partial differential equations which reduces to (1.4) for sufficiently smooth solutions. This follows from:

**Theorem 2.5 (Ball).** Assume \( \mathcal{U} = (u^1, u^2) \in \mathcal{A} \). Then for each \( \Phi \) in \( C^\infty_0(\Omega; \mathbb{R}^2) \) there is an \( \varepsilon_0 > 0 \) such that \( \mathcal{U}_\varepsilon(x; \Phi) \equiv \mathcal{U}(X + \varepsilon \Phi(X)) \in \mathcal{A} \) for \( |\varepsilon| \leq \varepsilon_0 \),
\[ \frac{d}{d\varepsilon} \mathcal{W}''(\mathcal{U}_\varepsilon) \bigg|_{\varepsilon=0} \]
exists and
\[ \frac{d}{d\varepsilon} \mathcal{W}''(\mathcal{U}_\varepsilon) \bigg|_{\varepsilon=0} = \int_\Omega -\sigma \cdot \delta^i_k + u^i_k \cdot \frac{\partial \sigma}{\partial u^j_x} \cdot \Phi^j_x \, dx \]
where \( \sigma = \sigma(D\mathcal{U}) = \frac{|D\mathcal{U}|^2}{2} + H(\det D\mathcal{U}) \) and \( X = (x_1, x_2) \). In particular if \( \mathcal{U} \) minimizes \( \mathcal{W}''(\mathcal{U}_0) \) in \( \mathcal{A}(\mathcal{U}_0) \), then
\[ \left( -\sigma \cdot \delta^i_k + u^i_k \cdot \frac{\partial \sigma}{\partial u^j_x} \right)_{x_j} = 0 \quad \text{in } \Omega \]
in the sense of distributions for \( k = 1, 2 \).

The proof of this result is described briefly in [2]. We prove it in detail in Appendix A, and we also show that the above system of partial differential equations simplifies to:
\[ f(d)_x = \frac{1}{2}(u^2_y + v^2_y - u^2_x - v^2_x)_x - (u_x u_y + v_x v_y)_y, \]
\[ f(d)_y = \frac{1}{2}(u^2_x + v^2_x - u^2_y - v^2_y)_y - (u_x u_y + v_x v_y)_x \]
in \( \Omega \) in the sense of distributions where \( \mathcal{U} = (u, v) \equiv (u^1, u^2) \) and \( X = (x_1, x_2) \equiv (x, y) \).

Based on these results, we make the following definition.

**Definition 2.6.** Suppose \( \mathcal{U} \in \mathcal{A} \). Then \( \mathcal{U} \) is said to be a weak equilibrium solution in \( \Omega \) if
\[ 0 = \frac{d}{d\varepsilon} \mathcal{W}''(\mathcal{U}_\varepsilon(X; \Phi)) \bigg|_{\varepsilon=0} \quad \text{for all } \Phi \in C^\infty_0(\Omega; \mathbb{R}^2), \]
equivalently, if (2.8) holds in the sense of distributions.
By Theorems 2.4 and 2.5, weak equilibrium solutions in $\mathcal{A}(\mathcal{U}_0)$ always exist. Differentiating the first equation in (2.8) with respect to $x$, the second with respect to $y$, and adding, we get (2.3) in $\mathcal{D}'(\Omega)$. From the proofs of Theorem 2.2 and Corollary 2.3 we conclude:

**Theorem 2.7.** Let $\mathcal{U}$ be a weak equilibrium solution in $\Omega$ with $|D\mathcal{U}|^2 \leq L^p_{\text{loc}}(\Omega)$ for some $p \in (1, \infty)$. Then $d^{-1} \in L^p_{\text{loc}}(\Omega)$ and if $\Omega' \subset \Omega'' \subset \Omega$,

$$\|d^{-1}\|_{L^p(\Omega')} \leq c_1 \cdot (1 + \|f (d)\|_{L^p(\Omega')}) \leq c_2 \cdot (1 + \mathcal{W}'(\mathcal{U}) + \|D\mathcal{U}\|^2_{L^p(\Omega'')})$$

where $c_1$ and $c_2$ depend on $\Omega'$, $\Omega''$, $H$ and $p$.

### 3. Maximum Principles for $z$ and $d$

In this section we prove via maximum principles that if $\mathcal{U}$ is a classical equilibrium solution, the functions $1 \equiv \frac{1}{d \det D\mathcal{U}}$ and $z \equiv \left| \frac{D\mathcal{U}}{2} + f (d) \right|$ attain their maxima on the boundary of $\Omega$. As a result, we obtain global bounds on $|D\mathcal{U}|$ and $|D\mathcal{U}^{-1}|$ in terms of their boundary values in $\Omega$.

Our proof is based on showing that $z$ and $d$ are sub and super solutions, respectively, for certain elliptic equations. We use the fact that $\sigma(F)$ is invariant under rotations in the reference and current configurations.

Assume that $\mathcal{P}$ and $\mathcal{Q}$ are in $\text{SO}(2)$, i.e. $\mathcal{P}$ and $\mathcal{Q}$ are real, orthogonal matrices with $\det \mathcal{P} = \det \mathcal{Q} = 1$. Assume $\mathcal{V} \in C^2(B_r(X_0); \mathbb{R}^2)$ with $\det D\mathcal{V} > 0$. Define $\tilde{\mathcal{V}}(X')$ on $B_r \equiv B_r(X_0)$ by

$$\tilde{\mathcal{V}}(X') = \mathcal{P} \cdot \mathcal{V}(X_0 + \mathcal{Q}(X' - X_0)) = \mathcal{P} \cdot \mathcal{V}(X)$$

where $X = X_0 + \mathcal{Q}(X' - X_0)$. It follows easily that

$$|D_{X'} \tilde{\mathcal{V}}(X')| = |D_X \mathcal{V}(X)|,$$

$$\det D_{X'} \tilde{\mathcal{V}}(X') = \det D_X \mathcal{V}(X),$$

and $|D^2_{X'} \tilde{\mathcal{V}}(X')| = |D^2_X \mathcal{V}(X)|$.

Hence

$$\int_{B_r} \sigma \left( D_{X'} \tilde{\mathcal{V}}(X') \right) dX' = \int_{B_r} \sigma \left( D_X \mathcal{V}(X) \right) dX.$$

From this we obtain:

**Proposition 3.1.** Assume $\mathcal{U}$ is a classical equilibrium solution in $B_r \equiv B_r(X_0) \subset \Omega$. Then $\tilde{\mathcal{U}}(X') \equiv (\tilde{u}(x', y'), \tilde{v}(x', y'))$ satisfies equations (1.4) in the variables $X' = (x', y')$ in $B_r$.
Proof. From our calculations on $\sigma$, we have:

$$0 = \left. \frac{d}{d\varepsilon} \int_{B_r} \sigma(D_X(\mathcal{H} + \varepsilon \Phi)) \, dX \right|_{\varepsilon = 0}$$

for all $\Phi$ in $C^1_0(B_r; \mathbb{R}^2)$ and hence

$$0 = \left. \frac{d}{d\varepsilon} \int_{B_r} \sigma(D_X(\mathcal{H} + \varepsilon \Phi)) \, dX' \right|_{\varepsilon = 0}. \quad \square$$

For $\mathcal{H}$ as above and $B_r = B_r(x_0) \subset \Omega$, we may choose $P$ and $Q$ so that $D_{X'}(x_0)$ is diagonal. Indeed, since $\det D_{X'}(x_0) > 0$, it has a polar decomposition: $D_{X'}(x_0) = CR$, where $C$ is symmetric and positive definite and $R \in SO(2)$. Hence $D_{X'}(x_0) = P^T \Lambda P$ where $P \in SO(2)$ and $\Lambda$ is diagonal and positive definite. Setting $Q = R^T P^T$ we have $D_{X'}(x_0) = \Lambda$ where $X' = X_0 + Q^{-1}(X - X_0)$ in $B_r$. We use this to prove:

**Theorem 3.2.** Let $\mathcal{H}$ be a classical equilibrium solution and set

$$z(X) = z(X; \mathcal{H}) = \frac{1}{2} |D\mathcal{H}(X)|^2 + f(\det D\mathcal{H}(X)).$$

Then $\Delta z \geq -H''(d) |\nabla z|^2$ in $\Omega$.

Proof. Fix $B_r \equiv B_r(x_0) \subset \Omega$. By (3.1),

$$z(X) = \frac{1}{2} |D\mathcal{H}(X')|^2 + f(\det D\mathcal{H}(X')) = z(X'; \mathcal{H}) \equiv \varphi(X') \quad \text{in } B_r.$$

Since the Laplacian is invariant under translations and rotations, $\Delta_X z(X_0) = \Delta_{X'} \varphi(X_0)$. From this, (3.1), and Proposition 3.1 we may assume without loss of generality that

$$D\mathcal{H}(X_0) = \begin{bmatrix} u_x(X_0) & 0 \\ 0 & v_y(X_0) \end{bmatrix}$$

with $u_x(X_0) > 0$ and $v_y(X_0) > 0$.

Consider the partial differential equation for $z$ found in Lemma 2.1, namely

$$\Delta z = 2(v_{xy}^2 - u_{xx} \cdot u_{yy}) + 2(u_{xy}^2 - v_{xx} \cdot v_{yy}).$$

At $X_0$:

$$v_{xy}^2 - u_{xx} \cdot u_{yy} = v_{xy}^2 + u_{xx} (u_{xx} + H'(d)) v_y = v_{xy}^2 + u_{xx}^2 + H''(d) (v_y^2 + u_{xx} v_y + u_x u_{xx} v_{xy})$$

where we used (1.4) for the first equality and

$$d_x(X_0) = \begin{bmatrix} u_{xx} v_y + u_x v_{xy} \end{bmatrix}(X_0)$$

for the second. Now

$$z_x = u_x u_{xx} + v_y v_{xy} + u_x v_y H''(d) (v_y, u_{xx} + u_x v_{xy})$$

at $X_0$. 

Annales de l'Institut Henri Poincaré - Analyse non linéaire
Solving for $v_{xy}$ in this equation we obtain

$$v_{xy} = \frac{z_x - u_x \cdot u_{xx} (1 + v_y^2 \cdot H''(d))}{v_y (1 + u_x^2 \cdot H''(d))} \quad \text{at } X_0.$$  

By (3.2) and (3.3), we have

$$v_{xy}^2 - u_{xx} \cdot u_{yy} 
= v_{xy}^2 + u_{xx}^2 \cdot (1 + v_y^2 \cdot H''(d)) + H''(d) \cdot v_y \cdot u_x \cdot u_{xx} \cdot v_{xy} \n= v_{xy}^2 + u_{xx}^2 \cdot (1 + v_y^2 \cdot H''(d)) \n+ v_y \cdot u_x \cdot H''(d) \cdot u_{xx} \cdot \frac{[z_x - u_x \cdot u_{xx} \cdot (1 + v_y^2 \cdot H''(d))]}{v_y (1 + u_x^2 \cdot H''(d))} \n= v_{xy}^2 + (1 + v_y^2 \cdot H''(d)) \cdot u_{xx} \cdot \left[1 - \frac{u_x^2 \cdot H''(d)}{1 + u_x^2 \cdot H''(d)} \right] \n+ \frac{u_x \cdot H''(d)}{(1 + u_x^2 \cdot H''(d))} \cdot z_x \cdot u_{xx} \n= \frac{[(1 + v_y^2 \cdot H''(d)) \cdot u_{xx} + u_x \cdot H''(d) \cdot u_{xx} \cdot z_x]}{(1 + u_x^2 \cdot H''(d))} \quad \text{at } X_0.$$  

Hence

$$v_{xy}^2 - u_{xx} \cdot u_{yy} \geq v_{xy}^2 + \frac{(u_{xx}^2 + u_x \cdot H''(d) \cdot u_{xx} \cdot z_x)}{(1 + u_x^2 \cdot H''(d))} \n= v_{xy}^2 + \frac{[(u_{xx} + (u_x \cdot H''(d)/2) \cdot z_x)^2 - (z_x^2 \cdot H''(d)/4) \cdot u_x^2 \cdot H''(d)]}{(1 + u_x^2 \cdot H''(d))} \n\geq - \frac{z_x^2 \cdot H''(d)}{4} \quad \text{at } X_0.$$  

A similar argument gives

$$u_{xy}^2 - v_{xx} \cdot v_{yy} \geq u_{xy}^2 + \frac{(v_{yy}^2 + v_y \cdot H''(d) \cdot v_{yy} \cdot z_y)}{(1 + v_y^2 \cdot H''(d))} \n\geq - \frac{z_y^2 \cdot H''(d)}{4} \quad \text{at } X_0.$$  

Thus $\Delta z \geq - H''(d) \cdot |\nabla z|^2$. □

By definition of classical equilibrium solutions, we have $f(d)$, $H''(d)$, $|\nabla f(d)|$, and $|\nabla z|$ locally bounded in $\Omega$. From this and Theorem 3.2 we obtain:

**Theorem 3.3.** Assume $\mathcal{U}$ is a classical equilibrium solution. Then $z(X)$ satisfies the strong maximum principle, i.e.

$$z(X) \leq \sup_{\Omega} z$$

for each $X$ in $\Omega$ with equality holding if and only if $z \equiv$ constant. Moreover if $z \equiv$ constant then $\mathcal{U}$ is affine, i.e. $\mathcal{U}(X) = AX + b$. 

Proof. – The strong maximum principle follows from the fact that \( z \) is a subsolution for the elliptic equation, \( \Delta z + H''(d) |\nabla z|^2 = 0 \). To prove the second assertion, it suffices to show that if \( z \equiv \text{constant} \) then \( D^2 \mathcal{U} = 0 \) in \( \Omega \). Fix \( X_0 \) in \( \Omega \). From (3.1) it follows without loss of generality that we may assume \( D\mathcal{U}(X_0) \) is diagonal. If \( z \equiv \text{constant} \), then by (3.4) and (3.5), we have

\[
\frac{1}{2} \Delta z \geq \frac{v^2_{xy}}{(1 + u^2_x \cdot H''(d))} + \frac{u^2_{xy}}{(1 + v^2_y \cdot H''(d))} \quad \text{at } X_0.
\]

Hence \( v_{xy} = u_{xx} = u_{xy} = v_{yy} = 0 \) at \( X_0 \). It follows that

\[
d_x(X_0) = [u_{xx} v_y + u_x v_{yx}](X_0) = 0
\]

and

\[
d_y(X_0) = [u_{xy} v_y + u_x v_{yy}](X_0) = 0.
\]

From this and (1.4) we have \( D^2 u(X_0) = D^2 v(X_0) = 0 \). □

We now proceed to obtain an elliptic equation for which \( d(X) = \det D\mathcal{U}(X) \) is a supersolution. Let \( F_1 \) and \( F_2 \) be linear operators defined by

\[
F_1(w) = (v_y w)_x - (v_x w)_y,
\]

\[
F_2(w) = (u_x w)_y - (u_y w)_x,
\]

where \( \mathcal{U} = (u, v) \) is a given classical equilibrium solution. Applying \( F_1 \) to (1.4)\(_1\), \( F_2 \) to (1.4)\(_2\), and adding we get:

\[
v_y \Delta u_x + u_x \Delta v_y - v_x \Delta u_y - u_y \Delta v_x
\]

\[
+ [(v^2_y + u^2_y) \cdot H''(d)_x] - [(u^2_x + v^2_x) \cdot H'(d)_x] y
\]

\[
- [(u^2_x + v^2_x) \cdot H'(d)_y] x + [(v^2_x + u^2_x) \cdot H'(d)_y] y = 0.
\]

Adding \( 2 \cdot \left\{ \langle \nabla u_x, \nabla v_y \rangle - \langle \nabla u_y, \nabla v_x \rangle \right\} \) to both sides and using the identity,

\[
\Delta d = v_y \Delta u_x + u_x \Delta v_y - v_x \Delta u_y - u_y \Delta v_x + 2 \cdot \left\{ \langle \nabla u_x, \nabla v_y \rangle - \langle \nabla u_y, \nabla v_x \rangle \right\},
\]

we obtain

\[
(3.6) \quad L_1(d) = \Delta d + [(u^2_y + v^2_y) \cdot H''(d) \cdot d_y] x
\]

\[
- [(u^2_x + v^2_x) \cdot H'(d) \cdot d_x] y
\]

\[
+ [(u^2_x + v^2_x) \cdot H'(d) \cdot d_y] x = 2 \cdot \left\{ \langle \nabla u_x, \nabla v_y \rangle - \langle \nabla u_y, \nabla v_x \rangle \right\}.
\]

Note that \( L_1(d) \) is an elliptic operator. In fact, we have:

Proposition 3.4. – Assume \( \mathcal{U} \) is a classical equilibrium solution. Define \( [a_{ij}] \) by \( L_1(d) = \sum_{i,j=1}^{2} (a_{ij}(X) \cdot d_x)_i d_y_j \) where \( X = (x, y) \equiv (x_1, x_2) \). Let \( \lambda_1 \leq \lambda_2 \) be the eigenvalues of \( [a_{ij}] \). Then \( \lambda_1 = 1 + v_1^2 \cdot H''(d) \) and \( \lambda_2 = 1 + v_2^2 \cdot H''(d) \)
where \(0 < \nu_1 \leq \nu_2\) are the singular values of \(D\mathcal{U}\). In particular,

\[
(3.7) \quad [1 + \nu_1^2, H''(d)] \cdot \xi^2 \leq \sum_{i,j=1}^{2} a_{ij} \cdot \xi_i \xi_j \leq [1 + \nu_2^2, H''(d)] \cdot \xi^2
\]

for all \(\xi \in \mathbb{R}^2\) and \(L_1\) is an elliptic operator.

**Proof.** – By direct calculation,

\[
tr [a_{ij}] = 2 + (u_x^2 + v_x^2 + u_y^2 + v_y^2) \cdot H''(d) = 2 + |D\mathcal{U}|^2 \cdot H''(d)
\]

and

\[
det [a_{ij}] = 1 + (u_x^2 + v_x^2 + u_y^2 + v_y^2) \cdot H''(d) + [(u_x^2 + v_x^2) (u_y^2 + v_y^2) - (u_x u_y + v_x v_y)^2]. H''(d)^2 = 1 + |D\mathcal{U}|^2 \cdot H''(d) + d^2 \cdot H''(d)^2.
\]

Since \(a_{ij}\) is a symmetric \(2 \times 2\) matrix, its eigenvalues are uniquely determined by these quantities. Hence

\[
\lambda_1 = 1 + \nu_1^2 \cdot H''(d) \quad \text{and} \quad \lambda_2 = 1 + \nu_2^2 \cdot H''(d). \quad \square
\]

Our maximum principle for \(d\) follows from an equation derived from (3.6). We shall need:

**Lemma 3.5.** – Assume \(P\) and \(Q\) are in \(SO(2)\) and \(V \in C^2(B_r(X_0))\).

Define \(\tilde{V}\) on \(B_r(X_0)\) by \(\tilde{V}(X') = P \cdot V(X)\) where \(X = X_0 + Q(X' - X_0)\). Let \(\tilde{V}(X) = (u(x, y), v(x, y))\) and \(\tilde{V}(X') = (\tilde{u}(x', y'), \tilde{v}(x', y'))\). Then

\[
\langle \nabla u, \nabla v \rangle - \langle \nabla u, \nabla v \rangle = \langle \nabla \tilde{u}, \nabla \tilde{v} \rangle - \langle \nabla \tilde{v}, \nabla \tilde{v} \rangle.
\]

**Proof.** – Since \(DV = P^T \cdot D\tilde{V} \cdot Q^T\), we have

\[
\frac{\partial \xi^i}{\partial x_j} = \sum_{k=1}^{2} p_{ki} \cdot \frac{\partial \xi^k}{\partial x_j} \cdot q_{ji}
\]

and

\[
\nabla \tilde{u} = \sum_{k=1}^{2} p_{ki} \cdot \nabla \tilde{u}_k \cdot Q^T \cdot q_{ji}.
\]

where

\[
(v_1, v_2) = (u, v), \quad (x_1, x_2) = (x, y), \quad (\tilde{v}_1, \tilde{v}_2) = (\tilde{u}, \tilde{v}),
\]

and \((x_1', x_2') = (x', y')\). Hence

\[
\begin{bmatrix}
\nabla u_x & \nabla u_y \\
\nabla v_x & \nabla v_y
\end{bmatrix} = P^T \cdot \begin{bmatrix}
\nabla \tilde{u}_x \cdot Q^T & \nabla \tilde{u}_y \cdot Q^T \\
\nabla \tilde{v}_x \cdot Q^T & \nabla \tilde{v}_y \cdot Q^T
\end{bmatrix} \cdot Q^T
\]

where the matrices in brackets are \(2 \times 2\) "block matrices" whose entries are in \(\mathbb{R}^2\), and the multiplication on the right is defined as in matrix
multiplication of three $2 \times 2$ matrices. Let the product of two vectors in $\mathbb{R}^2$ be their inner product. Then

$$\langle \nabla u_x, \nabla v_y \rangle - \langle \nabla u_y, \nabla v_x \rangle = \det \begin{bmatrix} \nabla u_x & \nabla u_y \\ \nabla v_x & \nabla v_y \end{bmatrix}$$

$$= \det \begin{bmatrix} \nabla \tilde{u}_x \cdot Q^T & \nabla \tilde{u}_y \cdot Q^T \\ \nabla \tilde{v}_x \cdot Q^T & \nabla \tilde{v}_y \cdot Q^T \end{bmatrix} Q^T$$

$$= \langle \nabla \tilde{u}_x, \nabla \tilde{v}_y \rangle - \langle \nabla \tilde{u}_y, \nabla \tilde{v}_x \rangle. \quad \square$$

We can now prove:

**Theorem 3.6.** Assume $\mathcal{U}$ is a classical equilibrium solution and define $[a_{ij}]$ as in Proposition 3.4. Then

$$(3.8) \quad L_1 (d) \equiv \sum_{i, j=1}^2 (a_{ij} d_{x_j})_{x_j}$$

$$\leq - \frac{1}{4} \frac{v_1}{v_2} \cdot |D^2 \mathcal{U}|^2 + \frac{1}{d} \cdot [2 + M_1 \cdot |D \mathcal{U}|^4 \cdot H'' (d)^2] \cdot |\nabla d|^2$$

and

$$(3.9) \quad L_2 (d) \equiv \sum_{i, j=1}^2 a_{ij} \cdot d_{x_i x_j}$$

$$\leq \frac{1}{d} \cdot [2 + M_2 \cdot |D \mathcal{U}|^4 \cdot H'' (d)^2 + M_3 \cdot d \cdot |H''' (d)| \cdot |D \mathcal{U}|^2] \cdot |\nabla d|^2$$

in $\Omega$ where $M_1$, $M_2$, and $M_3$ are universal constants (independent of $H$, $\mathcal{U}$, and $\Omega$).

**Proof.** First we prove (3.8). By (3.6) above,

$$L_1 (d) = 2 \cdot \{ \langle \nabla u_x, \nabla v_y \rangle - \langle \nabla u_y, \nabla v_x \rangle \} \equiv I.$$

We wish to estimate $I$ from above and we do this in terms of $|\nabla d|^2$. Fix an arbitrary $X_0$ in $\Omega$ and choose $r > 0$ so that $B_r (X_0) \subseteq \Omega$. Recall that there exists $P$ and $Q$ in SO (2) (depending on $X_0$) so that if $\tilde{\mathcal{U}} (X') = P \cdot \mathcal{U} (X)$ with $X = X_0 + Q (X' - X_0)$ then $D \tilde{\mathcal{U}} (X_0)$ is diagonal and positive definite. Note that $\tilde{d} (X') \equiv \det (D \tilde{\mathcal{U}} (X')) = \det (D \mathcal{U} (X)) \equiv d (X)$ and $|\nabla \tilde{d} (X')| = |\nabla d (X)|$. From this, Proposition 3.1, and Lemma 3.5, we may assume without loss of generality that $u_x = v_x = 0$ and $\{ u_x, v_y \} = \{ v_1, v_2 \}$ at $X_0$. By direct calculation,

$$I = 4 \langle \nabla u_x, \nabla v_y \rangle - 2 \{ \langle \nabla u_x, \nabla v_y \rangle + \langle \nabla u_y, \nabla v_x \rangle \}$$

$$= 4 \langle \nabla u_x, \nabla v_y \rangle - 2 \cdot (v_{xy} \cdot \Delta u + u_{xy} \cdot \Delta v).$$
Combining with (1.4) we obtain

$$I = 4 \langle \nabla u_x, \nabla v_y \rangle + 2 v_{xy} \cdot v_y \cdot H'(d)_x + 2 u_{xy} \cdot u_x \cdot H'(d)_y \quad \text{at } X_0.$$

Now

$$\nabla d = v_y \cdot \nabla u_x + u_x \cdot \nabla v_y - u_y \cdot \nabla v_x - v_x \cdot \nabla u_y.$$ Evaluating at $X_0$, we have:

$$|\nabla d|^2 = v^2_y + |\nabla u_x|^2 + 2 d \cdot \langle \nabla u_x, \nabla v_y \rangle + u^2_x \cdot |\nabla v_y|^2,$$

and hence

$$(3.10) \quad I = \frac{2}{d} \left\{ |\nabla d|^2 - v^2_y + |\nabla u_x|^2 - u^2_x \right\}$$

$$+ 2 v_y \cdot v_{xy} \cdot H''(d)_x \cdot d_x + 2 u_x \cdot u_{xy} \cdot H''(d)_y \cdot d_y \quad \text{at } X_0.$$ From (1.4) we have $u_{yy} = -u_{xx} - v_y \cdot H''(d)_x \cdot d_x$ at $X_0$. Thus

$$u^2_{yy} \leq 2 \cdot u^2_{xx} + 2 \cdot v^2_y \cdot H''(d)_x \cdot d^2_x$$

and we get

$$|\nabla u_x|^2 \geq \frac{|\nabla u_x|^2}{2} + \frac{u^2_{xx}}{2}$$

$$\geq \frac{|\nabla u_x|^2}{2} + \frac{u^2_{xx} - v^2_y \cdot H''(d)_x \cdot d^2_x}{4}$$

$$\geq \frac{|D^2 u|^2}{4} - \frac{v^2_y \cdot H''(d)_x \cdot |\nabla d|^2}{2} \quad \text{at } X_0.$$

In the same manner we find

$$|\nabla v_y|^2 \geq \frac{|D^2 v|^2}{4} - \frac{u^2_x \cdot H''(d)_x \cdot |\nabla d|^2}{2} \quad \text{at } X_0.$$ By (3.10) we obtain

$$I \leq \frac{2}{d} \left\{ \left[ 1 + \frac{v^4_y + u^4_x}{2} \right] \cdot |\nabla d|^2 - \frac{v^2_y}{4} \cdot |D^2 u|^2 - \frac{u^2_x}{4} \cdot |D^2 v|^2 \right\}$$

$$+ 2 (v_y + u_x) \cdot |D^2 u| \cdot H''(d)_x \cdot |\nabla d| \quad \text{at } X_0.$$ Since $\{u_x, v_y\} = \{v_1, v_2\}$ at $X_0$ we have $v_1 = \min \{u_x, v_y\}$ and $v_2 = \max \{u_x, v_y\}$. Thus

$$I \leq \frac{2}{d} \left\{ \left[ 1 + v^4_y \cdot H''(d)_x \right] \cdot |\nabla d|^2 - \frac{v^2_y}{4} \cdot |D^2 u|^2 \right\}$$

$$+ 4 \cdot v_2 \cdot |D^2 u| \cdot H''(d)_x \cdot |\nabla d|$$

$$= - \frac{1}{2} \cdot \frac{v_1}{v_2} \cdot |D^2 u|^2 + \frac{2}{d} \cdot (1 + v^4_y \cdot H''(d)_x) \cdot |\nabla d|^2$$

$$+ 4 \cdot v_2 \cdot |D^2 u| \cdot H''(d)_x \cdot |\nabla d| \quad \text{at } X_0.$$
The last term on the right is dominated by
\[ \frac{1}{4} \frac{v_1}{v_2} |D^2 \mathcal{U}|^2 + 4 \cdot \frac{v_2}{v_1} \cdot 4 \cdot v_2^2 \cdot H''(d)^2 \cdot |\nabla d|^2. \]

Hence
\[ I \leq - \frac{1}{4} \cdot \frac{v_1}{v_2} \cdot |D^2 \mathcal{U}|^2 + \frac{1}{d} \cdot \{ \frac{2 + 18 \cdot v_2^4 \cdot H''(d)^2}{d} \} \cdot |\nabla d|^2 \text{ at } X_0. \]
This proves (3.8).

To prove (3.9) we note that
\[
|L_1(d) - L_2(d)| = \left| \sum_{i,j=1}^{2} (a_{ij})x_j \cdot d_x \right|
\leq c_1 \cdot |D^2 \mathcal{U}| \cdot |D \mathcal{U}| \cdot H''(d) \cdot |\nabla d| + c_2 \cdot |D \mathcal{U}|^2 \cdot H''(d) \cdot |\nabla d|^2.
\]
\[
\leq \frac{c_1}{8} \cdot \frac{v_1}{v_2} \cdot |D^2 \mathcal{U}|^2 + 8 \cdot \frac{c_1 v_2}{v_1} \cdot c_1 \cdot |D \mathcal{U}|^2 \cdot H''(d) \cdot |\nabla d|^2 + c_2 \cdot |D \mathcal{U}|^2 \cdot H''(d) \cdot |\nabla d|^2.
\]
Combining this with (3.8) we obtain (3.9). □

The above theorem implies that \( d \) is a supersolution for an elliptic equation in \( \Omega \). As a consequence we have:

**Theorem 3.7.** If \( \mathcal{U} \) is a classical equilibrium solution, then
\[ d(X) \geq \inf_{\alpha \in \Omega} d \]
for each \( X \) in \( \Omega \) with equality holding if and only if \( d \) is constant. Moreover, in the latter case \( \mathcal{U} \) is affine.

**Proof.** Since \( d \) satisfies (3.8), the first assertion follows from the strong maximum principle. If \( d \) is constant, it follows from (3.8) that \( D^2 \mathcal{U} \equiv 0 \) in \( \Omega \) and hence \( \mathcal{U} \) is affine. □

We note that by (1.8), upper bounds on \( |D \mathcal{U}| \) and \( |D \mathcal{U}^{-1}| \) exist if and only if \( \left( \frac{1}{v_1} + v_2 \right) \) is bounded from above. The latter bound follows from Theorems 3.3 and 3.7. More precisely, we have:

**Theorem 3.8.** If \( \mathcal{U} \) is a classical equilibrium solution, then
\[ \sup_{\Omega} \left( \frac{1}{v_1} + v_2 \right) \leq \theta \]
where $\theta$ is a positive number depending only on $f$, $\inf_{\partial \Omega} v_1$, and $\sup_{\partial \Omega} v_2$.

**Proof.** Assume $d \geq d > 0$ in $\Omega$ and $z \leq \tilde{z} < \infty$ in $\Omega$, where $d = \det (D\Phi)$ and $z = \frac{|D\Phi|^2}{2} + f(d)$. Let $v = \inf_{\partial \Omega} v_1$ and $\bar{v} = \sup_{\partial \Omega} v_2$. Since

$$f'(d) = d. H''(d) > 0, f(d) \geq f(d) \quad \text{in } \Omega.$$  

Hence

$$\frac{v^2}{2} \leq z - f(d) \leq \tilde{z} - f(d) \quad \text{in } \Omega.$$  

It follows that

$$\frac{1}{v_1^2} = \frac{v^2}{d} \leq \frac{2[\tilde{z} - f(d)]}{d^2} \quad \text{in } \Omega.$$  

By Theorems 3.3 and 3.7 we may assume without loss of generality that $d \geq v^2$ and $\tilde{z} \leq \bar{v}^2 + f(\bar{v}^2)$. Thus

$$\left(\frac{1}{v_1} + v_2\right) \leq \theta (v, \bar{v}) \quad \text{in } \Omega. \quad \square$$

**4. INTERIOR ESTIMATES OF $z$ AND $\frac{1}{d}$**

In this section we prove $L^\infty$ estimates of $z$ and $\frac{1}{d}$ (and hence of $\frac{1}{v_1}$ and $v_2$) in subdomains $\Omega' \subset \subset \Omega$ in terms of $L^p$ estimates of $|D\Phi|$ in $\Omega$.

Our approach is based on an application of the Aleksandrov maximum principle to local estimates for nonlinear elliptic equations due to Trudinger. (See [9].)

We begin by recalling the estimate of Aleksandrov in the two-dimensional case. Let $\mathscr{D}$ be a bounded domain in $\mathbb{R}^2$. Let $[b_{ij}(X)]$ be a symmetric, positive definite, $2 \times 2$ matrix defined for $X$ in $\mathscr{D}$. Set $\mathcal{B}(X) = \det [b_{ij}(X)]$. If $\sigma \in C (\mathscr{D})$ define $\Gamma (\sigma)$ to be the upper contact set of $\sigma (X)$:

$$\Gamma (\sigma) = \{ Y \in \mathscr{D} : \sigma (X) \leq \sigma (Y) + \langle P, X - Y \rangle \}$$

for all $X$ in $\mathscr{D}$ and some $P = P (Y) \in \mathbb{R}^2$.  

The Aleksandrov Maximum Principle asserts the following: Let \( \varphi \in C^2(\Omega) \cap C_0(\Omega) \) and assume that \( \sum_{i,j=1}^2 b_{ij} \cdot \varphi_{x_i x_j} \geq \psi \) in \( \Omega \). Then

\[
\sup_{\partial} \varphi \leq c_0 \cdot (\text{diam } \Omega) \cdot \left( \int_{\Gamma(\varphi)} \frac{\psi^2}{\partial \Omega} \, d\sigma \right)^{1/2},
\]

where \( c_0 \) is a universal constant. (See Section 9.1 in [8].)

We are interested in interior estimates of \( C^2 \) solutions satisfying an inequality of the form

\[
\sum_{i,j=1}^2 b_{ij} \cdot \varphi_{x_i x_j} \geq g(X) \cdot |\nabla \varphi|^2
\]

in \( \Omega \). To this end, let \( \Omega = B_{2r} \equiv B_{2r}(X_0) \subset \Omega \) and define \( \eta(X) = \left( 4 - \frac{|X - X_0|^2}{r} \right)^2 \) for \( X \) in \( B_{2r} \). If \( w \in C^2(\Omega) \cap C_0(\Omega) \) and \( \varphi = \eta w \), then \( \varphi \in C^2(B_{2r}) \cap C_0(B_{2r}) \) and

\[
\sum_{i,j=1}^2 b_{ij} \cdot \varphi_{x_i x_j} \geq \eta \cdot g \cdot |\nabla \varphi|^2 + w \cdot \sum_{i,j=1}^2 b_{ij} \cdot \eta_{x_i x_j} + 2 \cdot \sum_{i,j=1}^2 b_{ij} \cdot \eta_{x_i} \cdot w_{x_j}
\]

in \( B_{2r} \). Now

\[
|\nabla \eta| \leq \frac{c_0}{r} \cdot \eta^{1/2} \quad \text{and} \quad |D^2 \eta| \leq \frac{c_0}{r^2}.
\]

Moreover, Trudinger observed that

\[
|\nabla w| \leq \frac{c_0}{r} \cdot \eta^{-1/2} \cdot w \quad \text{on } \Gamma(\varphi).
\]

[See inequality (10) of [9].] Now let \( b(X) \) be the largest eigenvalue of \( [b_{ij}(X)] \). By (4.1) and the above inequalities, we have

\[
\sum_{i,j=1}^2 b_{ij} \cdot \varphi_{x_i x_j} \geq -\frac{c_1}{r^2} \cdot (|g| \cdot w^2 + b \cdot w) \quad \text{on } \Gamma(\varphi)
\]

where \( c_1 \) is a universal constant. Since the Aleksandrov maximum principle requires such an estimate only on \( \Gamma(\varphi) \), we obtain:

\[
\sup_{B_{2r}} \varphi \leq \frac{c_2}{r} \cdot \left( \int_{\Gamma(\varphi)} \frac{(|g| \cdot w^2 + b \cdot w)^2}{\partial \Omega} \, dx \right)^{1/2}.
\]
Thus
\begin{equation}
\sup_{B_r} w \leq \frac{c_3}{r} \left( \int_{\Gamma(\Phi)} \frac{|g| \cdot |w^2 + b \cdot w|^2}{B} \, dx \right)^{1/2}.
\end{equation}

\begin{equation}
\leq \frac{c_4}{r} \left( \int_{\Gamma(\Phi)} \frac{(g^2 \cdot w^4 + b^2 \cdot w^2)}{B} \, dx \right)^{1/2}.
\end{equation}

where \( c_4 \) is a universal constant.

We use this inequality in two instances: first with \( w = 1 - \frac{1}{d} \) where \( d_0 \) is the constant defined in (1.2) and second with \( w = z = |D\mathcal{U}|^2 + f(d) \).

As we have seen in Section 3, supremum bounds on these two functions provide such bounds on \( \frac{1}{v_1} \) and \( v_2 \). In both applications we show that the integrand in (4.3) can be estimated in terms of \( \frac{1}{d} \) and \( |D\mathcal{U}| \).

**Lemma 4.1.** Let \( \mathcal{U} \) be a classical equilibrium solution in \( \Omega \) and assume that \( B_{2,r} \equiv B_{2,r}(X_0) \subset \Omega \). Then
\begin{equation}
\sup_{B_r} \frac{1}{d} \leq \frac{1}{d_0} + \frac{c}{r} \left( \int_{B_{2,r}} |D\mathcal{U}|^6 \cdot d^{-3} \cdot s^{-8} \, dx \right)^{1/2}
\end{equation}
where \( c \) is determined by the constants in (1.2).

**Proof.** We use \( c \) for all constants determined by (1.2). Observe that
\begin{equation}
L_2 \left( \frac{1}{d} \right) \equiv \sum_{i, j=1}^2 \frac{2}{a_{ij} \cdot \left( \frac{1}{d} \right)} x_i x_j
\end{equation}
\begin{equation}
= -\frac{1}{d^2} \cdot \left( \sum_{i, j=1}^2 a_{ij} \cdot d_{x_i x_j} \right) + \frac{2}{d^3} \cdot \left( \sum_{i, j=1}^2 a_{ij} \cdot d_{x_i} \cdot d_{x_j} \right).
\end{equation}
By (3.7) and (3.9), we have
\begin{equation}
L_2 \left( \frac{1}{d} \right) \geq -\frac{\|\nabla d\|^2}{d^3}
\end{equation}
\begin{equation}
\times [2 + M_2 \cdot |D\mathcal{U}|^4 \cdot H''(d)^2 + M_3 \cdot d \cdot |H'''(d)| \cdot |D\mathcal{U}|^2] + 2 \cdot \frac{\|\nabla d\|^2}{d^3} \cdot [1 + v_1^2 \cdot H''(d)]
\end{equation}
\begin{equation}
\geq -\left| \nabla \left( \frac{1}{d} \right) \right|^2 \cdot d \cdot [M_2 \cdot |D\mathcal{U}|^4 \cdot H''(d)^2 + M_3 \cdot d \cdot |H'''(d)| \cdot |D\mathcal{U}|^2].
\end{equation}
From (1.2) we obtain
\[
L_2 \left( \frac{1}{d} \right) \geq -c \left| \nabla \left( \frac{1}{d} \right) \right|^2 \cdot |D\mathcal{U}|^2 \cdot d^{-s-1} \cdot |D\mathcal{U}|^2 + 1 \quad \text{on} \quad \{d \leq d_0\}.
\]
Now \(d \leq |D\mathcal{U}|^2\) and so
\[
|D\mathcal{U}|^2 \cdot d^{-s-2} \geq d^{-s-1} \geq c \quad \text{on} \quad \{d \leq d_0\}.
\]
Thus if \(w = \frac{1}{d} - \frac{1}{d_0}\), we have
\[
L_2 (w) - c \cdot |D\mathcal{U}|^4 \cdot d^{-2s-3} \cdot |\nabla w|^2 \quad \text{on} \quad \{w \geq 0\}.
\]
Let \(\mathcal{D} = B_{2r}, \quad \varphi = \eta w, \) and \([b_{ij}] = [a_{ij}]\). By definition of \(\Gamma (\varphi)\) and since \(\varphi = 0\) on \(\partial \mathcal{D} = \partial B_{2r}\), it follows that \(\Gamma (\varphi) \subset \{w \geq 0\}\). Hence \(\Gamma (\varphi) \subset \{d \leq d_0\}\) and
\[
w^2 \leq d^{-2s} \quad \text{on} \quad \Gamma (\varphi).
\]
By Proposition 3.4,
\[
\mathcal{B} (X) \geq [1 + v_1^2 \cdot H'' (d)]. [1 + v_2^2 \cdot H'' (d)]
\]
\[
= 1 + |D\mathcal{U}|^2 \cdot H'' (d) + d^2 \cdot H'' (d)^2.
\]
Hence on \(\Gamma (\varphi)\),
\[
\mathcal{B} (X) \geq c \cdot (|D\mathcal{U}|^2 \cdot d^{-s-2} + d^{-2s-2})
\]
\[
= c \cdot d^{-s-2} \cdot (|D\mathcal{U}|^2 + d^{-s}).
\]
Also by Proposition 3.4,
\[
b (X) = 1 + v_2^2 \cdot H'' (d)
\]
\[
\leq 1 + c \cdot |D\mathcal{U}|^2 \cdot d^{-s-2}
\]
\[
\leq c \cdot |D\mathcal{U}|^2 \cdot d^{-s-2} \quad \text{on} \quad \Gamma (\varphi).
\]
From this (4.3), (4.5), and (4.6) we have
\[
\sup_{B_r} w \leq C \left[ \int_{\Gamma (\varphi)} \left( \frac{|D\mathcal{U}|^8 \cdot d^{-4s-6} \cdot w^4 + |D\mathcal{U}|^4 \cdot d^{-2s-4} \cdot w^2}{d^{-s-2} \cdot (|D\mathcal{U}|^2 + d^{-s})} \right)^{1/2} dX \right]^{1/2}
\]
\[
\leq \frac{C}{r} \left[ \int_{\Gamma (\varphi)} \left( \frac{|D\mathcal{U}|^8 \cdot d^{-3s-8} + |D\mathcal{U}|^4 \cdot d^{-s-4} \cdot w^2}{(|D\mathcal{U}|^2 + d^{-s})} \right)^{1/2} dx \right]^{1/2}
\]
\[
\leq \frac{C}{r} \left[ \int_{\Gamma (\varphi)} \left( |D\mathcal{U}|^6 \cdot d^{-3s-8} + |D\mathcal{U}|^2 \cdot d^{-s-4} \right) dx \right]^{1/2}.
\]
By (4.4),
\[
|D\mathcal{U}|^2 \cdot d^{-s-4} \leq c \cdot |D\mathcal{U}|^6 \cdot d^{-3s-8} \quad \text{on} \quad \Gamma (\varphi).
\]
Thus
\[
\sup_{B_r} \frac{1}{d} \leq \frac{1}{d_0} + \frac{c}{r} \left[ \int_{\Gamma (\varphi)} |D\mathcal{U}|^6 \cdot d^{-3s-8} \right]^{1/2}.
\]
\[\square\]
The above lemma and Theorem 2.2 can be combined to prove:

**Theorem 4.2.** Assume \( \mathcal{U} \) is a classical equilibrium solution in \( \Omega \) and \( \Omega' \subset \subset \Omega \). Then

\[
\sup_{\Omega'} \frac{1}{d} \leq c \left[ 1 + \mathcal{W}^\prime (\mathcal{U})^{6 + 8} + \int_{\Omega} |D\mathcal{U}|^{12 + 6} \, dX \right]^{1/2}
\]

where \( c \) is a constant depending on \( \Omega' \), \( \Omega \), and the constants in (1.2).

**Proof.** Suppose \( B_2 \equiv B_2 (X_0) \subset \Omega \). By Lemma 4.1 it follows that

\[
\left( \sup_{B_r} \frac{1}{d} \right)^2 \leq \frac{c}{r^2} \left[ \int_{B_2} (1 + |D\mathcal{U}|^6 \cdot d^{-3-8}) \, dX \right]
\]

where \( c \) depends on the constants in (1.2). Applying Young’s inequality, namely \( |ab| \leq \frac{1}{p} |a|^p + \frac{1}{q} |b|^q \) with \( p = \frac{6 + 8}{3 + s} \) and \( q = \frac{6 + 8}{3 + s} \), we obtain

\[
\left( \sup_{B_r} \frac{1}{d} \right)^2 \leq \frac{c}{r^2} \left[ \int_{B_2} \left\{ 1 + \frac{1}{p} \| D\mathcal{U} \|^{12 + 6} + \frac{1}{q} \| D\mathcal{U} \|^{6 + 8} \right\} \, dX \right]
\]

Combining this with Corollary 2.3 gives the desired conclusion.

We do a similar analysis to obtain local supremum estimates of \( z \) (and hence of \( |D\mathcal{U}| \)) in terms of \( L^p_{\text{loc}} \) estimates of \( |D\mathcal{U}| \):

**Lemma 4.3.** Suppose \( \mathcal{U} \) is a classical equilibrium solution. If \( B_2 \equiv B_2 (X_0) \subset \Omega \), the function \( z(X) = \frac{1}{2} |D\mathcal{U}|^2 + f(d) \) satisfies

\[
\sup_{B_r} z \leq \frac{c}{r} \left[ \int_{B_2} (z^2 + H''(d) \, dX) \right]^{1/2}
\]

where \( c \) is a universal constant.

**Proof.** By Theorem 3.2, \( z \) satisfies

\[
\Delta z \geq -H''(d) \cdot |\nabla z|^2 \quad \text{in } \Omega.
\]

Applying (4.3) with \([b_{ij}] = [\delta_{ij}] \) gives the desired inequality.

**Theorem 4.4.** Assume \( \mathcal{U} \) is a classical equilibrium solution and \( \Omega' \subset \subset \Omega'' \subset \subset \Omega \). Then

\[
\sup_{\Omega''} z \leq c_1 \left[ 1 + \int_{\Omega''} |D\mathcal{U}|^{16 + f(d)^{6 + 8}} \, dX \right]^{1/2}
\]

\[
\leq c_2 \left[ 1 + \mathcal{W}^\prime (\mathcal{U})^{6 + 8} + \int_{\Omega} |D\mathcal{U}|^p \, dX \right]^{1/2}
\]

where $p = \max \left( 16, 12 + \frac{16}{s} \right)$ and the constants $c_1$ and $c_2$ depend on $\Omega$, $\Omega'$, $\Omega''$, and $H$.

Proof. – Since $f'(d) = d \cdot H''(d)$ we have

$$f(d) - f(a) = \int_a^d \zeta \cdot H''(\zeta) \, d\zeta.$$  

Now $H''(d) \sim d^{-s-2}$ for $d \leq d_0$ and $H''(d) \sim d^s$ for $d \geq d_1$. It follows that $|f(d)| \geq c_1 \cdot d^2 \cdot H''(d) - c_2$ for $d \leq d_0$ or $d \geq d_1$, where $c_1$ and $c_2$ are positive constants depending on $H$. Since $H'' > 0$ and $f' > 0$, we obtain:

$$d^2 H''(d) \leq c (|f(d)| + 1)$$

for all $d > 0$.

Now assume that $B_{6r} = B_{6r}(X_0) \subset \Omega$. By Lemma 4.3 and the above estimate on $H''(d)$,

$$(4.7) \quad (\sup_{B_r} z^+)^2 \leq \frac{c}{r^2} \int_{B_{2r}} (z^4 \cdot H''(d)^2 + z^2) \, dX$$

$$\leq \frac{c}{r^2} \int_{B_{2r}} \left\{ |D\mathcal{V}|^8 + f(d)^4 \cdot [1 + f(d)^2] \cdot d^{-4} + |D\mathcal{V}|^4 + f(d)^2 \right\} \, dX$$

where $z^+ = \max \{z, 0\}$. In $B_{2r} \cap \{d \geq d_0\}$, $d^{-4}$ is bounded above by a constant. Hence

$$c \cdot \int_{B_{2r} \cap \{d \geq d_0\}} (|D\mathcal{V}|^8 + f(d)^4) \cdot [1 + f(d)^2] \cdot d^{-4} + |D\mathcal{V}|^4 + f(d)^2 \, dX$$

$\leq \frac{c}{r^2} \int_{B_{2r}} (1 + |D\mathcal{V}|^4 + f(d)^4) \, dX$

$\leq \frac{c}{r^2} \int_{B_{2r}} (1 + |D\mathcal{V}|^4 + f(d)^6) \, dX$.

In $B_{2r} \cap \{d \leq d_0\}$, we have $c_3 \leq d^{-s} \leq c_4 \cdot |f(d)|$. [See (2.7)]. Hence $d^{-8} \leq c \cdot |f(d)|^{8/s}$ and

$$\frac{c}{r^2} \int_{B_{2r} \cap \{d \leq d_0\}} (|D\mathcal{V}|^8 + f(d)^4) \cdot [1 + f(d)^2] \cdot d^{-4} + |D\mathcal{V}|^4 + f(d)^2 \, dX$$

$\leq \frac{c}{r^2} \int_{B_{2r}} (|D\mathcal{V}|^4 + [1 + f(d)^6] \cdot d^{-8}) \, dX$

$\leq \frac{c}{r^2} \int_{B_{2r}} (|D\mathcal{V}|^4 + 1 + |f(d)|^{6+(8/s)}) \, dX$.
where $c$ depends on $H$. By (4.7) and the above estimates,

$$
(\text{sup}_{B_r} z^+)^2 \leq \frac{c}{r^2} \int_{B_{2r}} (1 + |D\mathcal{U}|^{16} + |f(d)|^{6+(8/s)}) \, dX.
$$

Now by Theorem 2.2, the term on the right is bounded by

$$
\frac{c}{r^2} \left[ 1 + W^{-} (\mathcal{U})^{6+(8/s)} + \int_{B_6} (1 + |D\mathcal{U}|^{16} + |D\mathcal{U}|^{12+(16/s)}) \, dX \right].
$$

The conclusion of the theorem follows from this and (4.8). □

Recall that $z = \frac{1}{2} (v_1^2 + v_2^2) + f(v_1 v_2)$ and $\frac{1}{d} \frac{v_1}{v_2}$. It follows from Theorems 4.2 and 4.4 that $1 + v_1 v_2$ (and hence $|D\mathcal{U}|$ and $|D\mathcal{U}^{-1}|$) are bounded on compact subdomains of $\Omega$ by constants depending on $H$, $W^{-} (\mathcal{U})$, and $\|D\mathcal{U}\|_{L^p(\Omega)}$ where $p = \max \left\{ 16, 12 + \frac{16}{s} \right\}$. More precisely, we have:

**THEOREM 4.5.** If $\mathcal{U}$ is a classical equilibrium solution and $\Omega' \subseteq \Omega$, then

$$
\sup_{\Omega'} \left( \frac{1}{v_1} + v_2 \right) \leq \theta
$$

where $\theta$ is a constant depending only on $W^{-} (\mathcal{U})$, $|D\mathcal{U}|_{L^p(\Omega)}$, $H$, $\Omega'$, and $\Omega$.

**Proof.** Let

$$
c_1 = \left[ 1 + W^{-} (\mathcal{U})^{6+(8/s)} + \int_{\Omega} |D\mathcal{U}|^p \, dX \right]^{1/2}
$$

where

$$
p = \max \left\{ 16, 12 + \frac{16}{s} \right\}.
$$

By Theorems 4.2 and 4.4 there exists a constant $c_2 > 0$ depending only on $\Omega$, $\Omega'$, and $H$ such that

$$
\sup_{\Omega'} z \leq c_1 \cdot c_2 \quad \text{and} \quad \sup_{\Omega'} \frac{1}{d} \leq c_1 \cdot c_2.
$$

Let $c = c_1 \cdot c_2$ and $\tilde{c} = \frac{1}{c_1 c_2}$. Then

$$
v_1^2 + v_2^2 + 2 \cdot f(v_1 v_2) \equiv 2 \cdot z \leq c \quad \text{and} \quad v_1 v_2 \equiv d \geq \tilde{c} \quad \text{in} \ \Omega'.
$$
Since $f$ is increasing it follows that
\[ v_2^2 \leq c - 2 \cdot f(v_1, v_2) \leq c - 2 \cdot f(\bar{c}) \quad \text{and} \quad \frac{1}{v_1} = \frac{v_2}{d} \leq c \cdot \sqrt{c - 2 \cdot f(\bar{c})}. \]
The theorem follows if we set $\theta = (1 + c) \cdot \sqrt{c - 2 \cdot f(\bar{c})}$. □

5. \textit{C}^k, \alpha \textit{ESTIMATES OF CLASSICAL EQUILIBRIUM SOLUTIONS}

In this section we prove a Caccioppoli inequality on $D\mathcal{U}$ (Lemma 5.1). As a consequence, we obtain \textit{a priori} Hölder estimates of $D\mathcal{U}$ on subdomains $\Omega' \subset \Omega'' \subset \Omega$ in terms of $\sup_{\Omega'} v_1$ and $\beta_2 = \sup_{\Omega''} v_2$ (and
\[ \beta_1 = \sup_{\Omega'} v_1 \]
hence in terms of $\mathcal{W}$ ($\mathcal{U}$) and $\|D\mathcal{U}\|_{L^p(\Omega)}$. Classical elliptic theory then
provides estimates of $\|\mathcal{U}\|_{C^{k, \alpha} (\Omega)}$ for $k \geq 2$ in terms of
\[ \beta_1, \beta_2, \|H\|_{C^{k, \alpha} (\Omega)}, \|\mathcal{U}\|_{L^2(\Omega)}, \text{and} \|D\mathcal{U}\|_{C^0(\Omega'')}. \]

We denote by $\overline{F}_{X_0, r}$, the average of $F$ over $B_r$, namely $\int_{B_r} F(x) \, dx$.

\textbf{Lemma 5.1 (Caccioppoli inequality on $D\mathcal{U}$).} Let $\mathcal{U}$ be a classical equilibrium solution and assume that $B_{2r} = B_{2r} (X_0) \subset \Omega''$. Then
\[ \int_{B_r} |D^2 \mathcal{U}|^2 \, dX \leq c \cdot \int_{B_{2r}} |D\mathcal{U} - D\mathcal{U}_{X_0, 2r}|^2 \, dX \]
where $c = c(\beta_1, \beta_2)$.

\textbf{Proof.} We use $M$ for universal constants and $c_j$ for constants depending only on $\beta_1$ and $\beta_2$. Let $d = \det D\mathcal{U}_{X_0, 2r}$ and set
\[ \phi = \eta^2 \cdot (e^{-kd} - e^{-\kappa d}), \]
where $k$ is a positive constant to be determined and $\eta \in C^0_1(B_{2r})$ with $\eta = 1$ on $B_r$ and $|\nabla \eta| \leq \frac{M}{r}$. By (3.6), $L_1 (d) = 2 \cdot \{ \langle \nabla u, \nabla v \rangle - \langle \nabla u, \nabla v \rangle \}$ in $B_{2r}$. Multiplying by $\phi$ and integrating by parts, we obtain
\[ \int_{B_{2r}} L_1 (d) \cdot \phi \, dX = k \cdot \int_{B_{2r}} (a_{ij} d_{xi} d_{xj}) \cdot e^{-kd} \cdot \eta^2 \, dX \]
\[ - \int_{B_{2r}} 2a_{ij} \cdot d_{xi} \cdot \eta_{xj} \cdot \eta \cdot (e^{-kd} - e^{-\kappa d}) \, dX. \]
The second term on the right is bounded in absolute value by
\[ \int_{B_{2r}} |\nabla d|^2 \cdot \eta^2 \cdot e^{-kd} \, dX + \frac{c_1}{r^2} \cdot \int_{B_{2r}} \left| e^{-kd} - e^{-\kappa d} \right|^2 \cdot e^{kd} \, dX. \]
Hence
\[ \int_{B_{2r}} L_1(d) \cdot \varphi \, dX \]
\[ \geq k \int_{B_{2r}} \left\{ \| \nabla d \|^2 + H''(d) \cdot [(u_x^2 + v_x^2) \cdot d_x^2 - 2 \cdot (u_x \cdot v_x + v_x \cdot v_y) \times d_x \cdot d_y + (v_x^2 + u_x^2) \cdot d_y^2] \cdot e^{-kd} \cdot \eta^2 \right\} dX \]
\[ - \int_{B_{2r}} \| \nabla d \|^2 \eta^2 e^{-kd} \, dX - \frac{c_1}{r^2} \int_{B_{2r}} \left| e^{-kd} - e^{-kd_{\bar{u}}} \right|^2 \cdot e^{kd} \, dX. \]

Setting
\[ E = [(u_x^2 + v_x^2) \cdot d_x^2 - 2 \cdot (u_x \cdot v_x + v_x \cdot v_y) \cdot d_x \cdot d_y + (u_x^2 + v_x^2) \cdot d_y^2], \]
we obtain
\[(5.1) \quad k \int_{B_{2r}} \| \nabla d \|^2 \cdot e^{-kd} \cdot \eta^2 \, dX + k \int_{B_{2r}} H''(d) \cdot E \cdot e^{-kd} \cdot \eta^2 \, dX \]
\[ \leq \int_{B_{2r}} L_1(d) \cdot \varphi \, dX + \int_{B_{2r}} \| \nabla d \|^2 \cdot e^{-kd} \cdot \eta^2 \, dX \]
\[ + \frac{c_1}{r^2} \int_{B_{2r}} \left| e^{-kd} - e^{-kd_{\bar{u}}} \right|^2 \cdot e^{kd} \, dX. \]

Now
\[ \int_{B_{2r}} L_1(d) \cdot \varphi \, dX = \int_{B_{2r}} L_1(d) \cdot e^{-kd} \cdot \eta^2 \, dX - \int_{B_{2r}} L_1(d) \cdot e^{-kd_{\bar{u}}} \cdot \eta^2 \, dX \equiv I + II. \]
By Theorem 3.6,
\[(5.2) \quad I \leq c_2 \int_{B_{2r}} \| \nabla d \|^2 \cdot e^{-kd} \cdot \eta^2 \, dX. \]

To estimate II, we use the fact that
\[ L_1(d) = 2 \cdot \left\{ \langle \nabla u_x, \nabla v_y \rangle - \langle \nabla u_x, \nabla v_x \rangle \right\} \]
\[ = 2 \langle (\nabla u - \nabla \overline{u}_{X_0, 2r}), \nabla v_y \rangle_x - 2 \langle (\nabla u - \nabla \overline{u}_{X_0, 2r}), \nabla v_x \rangle_y. \]
Hence
\[ |II| = 4e^{-kd_{\bar{u}}} \left| \int_{B_{2r}} \left\{ \langle \nabla u - \nabla \overline{u}_{X_0, 2r}, \nabla v_y \rangle \cdot \eta_x \cdot \eta \right. \]
\[ \left. - \langle \nabla u - \nabla \overline{u}_{X_0, 2r}, \nabla v_x \rangle \cdot \eta_y \cdot \eta \right\} \, dX \right| \]
\[ \leq \varepsilon \int_{B_{2r}} |D^2 \mathcal{H}|^2 \cdot \eta^2 \, dX + \frac{M}{\varepsilon r^2} \cdot e^{-2kd_{\bar{u}}} \int_{B_{2r}} |D\mathcal{H} - D\mathcal{H}_{X_0, 2r}|^2 \, dX \]
for any \( \varepsilon > 0. \)

From this estimate and (5.2) we get

\[ \int_{B_{2r}} \mathbf{L}(x,d) \cdot \varphi \, dX \]

\[ \leq c_2 \int_{B_{2r}} |\nabla d|^2 \cdot e^{-kd} \cdot \eta^2 \, dX + \varepsilon \int_{B_{2r}} |D^2 \mathcal{U}|^2 \cdot \eta^2 \, dX \]

\[ + \frac{M}{\varepsilon r^2} e^{-2k\tilde{d}} \int_{B_{2r}} |\mathcal{U} - \overline{\mathcal{U}}_{X_0,2r}|^2 \, dX. \]

Combining this inequality and (5.1) we have

(5.3) \[ k \int_{B_{2r}} |\nabla d|^2 \cdot e^{-kd} \cdot \eta^2 \, dX \]

\[ + k \int_{B_{2r}} H''(d) \cdot E \cdot e^{-kd} \cdot \eta^2 \, dX \]

\[ \leq (1 + c_2) \int_{B_{2r}} |\nabla d|^2 \cdot e^{-kd} \cdot \eta^2 \, dX + \frac{c_1}{r^2} \]

\[ \times \int_{B_{2r}} e^{kd} \cdot |e^{-kd} - e^{-k\tilde{d}}|^2 \, dX + \varepsilon \int_{B_{2r}} |D^2 \mathcal{U}|^2 \cdot \eta^2 \, dX \]

\[ + \frac{M}{\varepsilon r^2} e^{-2k\tilde{d}} \int_{B_{2r}} |\mathcal{U} - \overline{\mathcal{U}}_{X_0,2r}|^2 \, dX. \]

Now set \( k = 1 + c_2 \). Then \( k = k(\beta_1, \beta_2) \) which implies that

\[ e^{kd} + e^{-2k\tilde{d}} \leq c_3 \quad \text{and} \quad |e^{-kd} - e^{-k\tilde{d}}| \leq c_4 \cdot |\mathcal{U} - \overline{\mathcal{U}}|_{X_0,2r} \quad \text{in } B_{2r}. \]

Our estimate (5.3) simplifies to

(5.4) \[ k \int_{B_{2r}} H''(d) \cdot E \cdot e^{-kd} \cdot \eta^2 \, dX \]

\[ \leq \left( c_5 + \frac{c_6}{\varepsilon} \right) \frac{1}{r^2} \int_{B_{2r}} |\mathcal{U} - \overline{\mathcal{U}}_{X_0,2r}|^2 \, dX \]

\[ + \varepsilon \int_{B_{2r}} |D^2 \mathcal{U}|^2 \cdot \eta^2 \, dX. \]

Observe that if we solve (1.4) for \( \Delta u \) and (1.4) for \( \Delta v \), square each equation, and add the results, we obtain

\[ H''(d)^2 \cdot E = (\Delta u)^2 + (\Delta v)^2. \]
Choose $\theta \equiv \theta (\beta_1, \beta_2) = \inf_{\beta_2 \geq \beta_1} \frac{k e^{-k d}}{H''(d)} > 0$. By (5.4) we have

$$\theta \cdot \int_{B_2r} [(\Delta u)^2 + (\Delta v)^2] \cdot \eta^2 \, dx$$

$$\leq \left( c_5 + \frac{c_6}{\epsilon} \right) \cdot \frac{1}{r^2} \cdot \int_{B_2r} |D \mathcal{U} - D \mathcal{U}_{X_0, 2r}|^2 \, dx$$

$$+ \epsilon \cdot \int_{B_2r} |D^2 \mathcal{U}|^2 \cdot \eta^2 \, dx.$$

It is shown in Appendix B that

$$\int_{B_2r} [(\Delta u)^2 + (\Delta v)^2] \cdot \eta^2 \, dx$$

$$\leq \frac{1}{2} \int_{B_2r} |D^2 \mathcal{U}|^2 \cdot \eta^2 \, dx - \frac{M}{r^2} \cdot \int_{B_2r} |D \mathcal{U} - D \mathcal{U}_{X_0, 2r}|^2 \, dx.$$

Hence

$$\frac{\theta}{2} \cdot \int_{B_2r} |D^2 \mathcal{U}|^2 \cdot \eta^2 \, dx$$

$$\leq \left( c_7 + \frac{c_6}{\epsilon} \right) \cdot \frac{1}{r^2} \cdot \int_{B_2r} |D \mathcal{U} - D \mathcal{U}_{X_0, 2r}|^2 \, dx$$

$$+ \epsilon \cdot \int_{B_2r} |D^2 \mathcal{U}|^2 \cdot \eta^2 \, dx.$$

Setting $\epsilon = \frac{\theta}{4}$ we have our assertion. □

The above lemma and the Sobolev-Poincaré inequality imply the following:

**Theorem 5.2.** Assume $\mathcal{U}$ is a classical equilibrium solution and $\Omega' \subset \subset \Omega$. Then

$$\| D \mathcal{U} \|_{C^r(\Omega')} \leq c$$

where $\alpha$ and $c$ are positive constants depending only on $\Omega$, $\Omega'$, $H$, $W'(\mathcal{U})$, and $\| D \mathcal{U} \|_{L^p(\Omega)}$ with $p = \max \left( 16, 12 + \frac{16}{s} \right)$.

**Proof.** Without loss of generality assume that $\Omega'$ is a Lipschitz domain. (If not, we can replace $\Omega'$ with a Lipschitz domain, $\Omega_0$, satisfying $\Omega' \subset \subset \Omega_0 \subset \subset \Omega$.) Choose $\Omega''$ and $\Omega'''$ so that $\Omega' \subset \subset \Omega'' \subset \subset \Omega$ and assume
By the Sobolev-Poincaré inequality,

\[ \int_{B_{2r}} \left| \nabla \varphi - \frac{\partial \mathcal{U}}{\partial x} \right|^2 dx \leq c_0 \cdot \left( \int_{B_{2r}} \left| D^2 \varphi \right|^2 dx \right)^{1/2} \]

where \( c_0 \) is independent of \( r \). Combining this with Lemma 5.1, we obtain the following “reverse-Hölder” type of inequality:

\[ \left( \int_{B_r} \left| D^2 \mathcal{U} \right|^2 dx \right)^{1/2} \leq c_1 \cdot \int_{B_{2r}} \left| D^2 \mathcal{U} \right| dx \]

where \( c_1 = c_1(\beta_1, \beta_2), \beta_1 = \inf_{\Omega''} v_1 \) and \( \beta_2 = \sup_{\Omega''} v_2 \). It follows (by Proposition 1.1 of Chapter V in [6] and Lemma 5.1) that there exist constants \( q > 2 \) and \( c_2 \) and \( c_3 > 0 \) depending only on \( \Omega', \Omega'', \beta_1 \) and \( \beta_2 \) such that

\[ \| D^2 \mathcal{U} \|_{L^q(\Omega')} \leq c_2 \cdot \| D^2 \mathcal{U} \|_{L^2(\Omega'')} \leq c_3. \]

By the Sobolev imbedding theorem and the above inequality,

\[ \| D \varphi \|_{C^{\alpha}(\Omega')} \leq c \cdot \| D^2 \mathcal{U} \|_{W^{1,q}(\Omega')} \leq c_4 \]

where \( \alpha = 1 - \frac{2}{q} \) and \( c_4 \) depends only on \( \Omega', \Omega'', \beta_1 \) and \( \beta_2 \). By Theorem 4.5,

\[ c_4 \leq c_5 \]

where \( c_5 \) depends only on \( \Omega, \Omega', \Omega'', H, \mathcal{W}(\varphi) \) and \( \| D \varphi \|_{L^p(\Omega')} \). The theorem now follows from (5.5) and (5.6).

We conclude this section with the following results concerning higher order a priori estimates.

**Lemma 5.3.** Assume \( \varphi \) is a classical equilibrium solution, \( \Omega' \subset \Omega \), and \( \alpha \) is the exponent defined in Theorem 5.2. Then

\[ \| \varphi \|_{C^{2,\alpha}(\Omega')} \leq c \]

where \( c \) depends on \( \Omega, \Omega', H, \mathcal{W}(\varphi), \| \varphi \|_{L^2(\Omega')}, \) and \( \| D \varphi \|_{L^p(\Omega')} \) with \( p = \max \left\{ 16, 12 + \frac{16}{s} \right\} \).

**Proof.** We observe that \( \varphi \) satisfies (1.4) which can be written as

\[ \sum_{j=1}^2 \frac{\partial}{\partial x_j} \left( \frac{\partial \varphi}{\partial F_{ij}} (D \varphi) \right) = 0 \quad \text{for} \quad i = 1, 2 \]
where \((x_1, x_2) = (x, y), (u_1, u_2) = (u, v) = \mathcal{U}\) and \(F_{ij} = \frac{\partial u_i}{\partial x_j}\). Differentiating this system with respect to \(x_q\), we have
\[
(5.7) \quad \sum_{j, m, n=1}^2 \frac{\partial}{\partial x_j} \left( \frac{\partial^2 \sigma}{\partial F_{mn} \partial F_{ij}} (D\mathcal{U}) \frac{\partial^2 u_m}{\partial x_q \partial x_n} \right) = 0 \quad \text{for} \quad i = 1, 2.
\]
If we set \(A_{jm}^m(X) = \frac{\partial^2 \sigma}{\partial F_{mn} \partial F_{ij}} (D\mathcal{U}(X))\) and \(v_m = \frac{\partial u_m}{\partial x_q}\), equation (5.7) becomes
\[
(5.8) \quad \sum_{j, m, n=1}^2 \frac{\partial}{\partial x_j} \left( A_{jm}^m(X) \frac{\partial v_m}{\partial x_n} \right) = 0 \quad \text{for} \quad i = 1, 2.
\]
Choose \(\Omega''\) so that \(\Omega' \subset \subset \Omega'' \subset \subset \Omega\). Then
\[
\| A_{jm}^m \|_{C^1(\Omega'')} \leq c_1
\]
where \(c_1\) depends on \(\Omega'', \Omega, H, \mathcal{W}(\mathcal{U}), \) and \(D\mathcal{U}\|_{L^p(\Omega)}\). Indeed we have \(\sigma(F) = \frac{|F|^2}{2} + H(\det F)\). Now \(H \in C^3(\mathbb{R}^+), \mathcal{W} \in C^{1,2}(\Omega''),\) and Theorems 4.2 and 5.2 imply that
\[
0 < d \leq \det D\mathcal{U}(X) \leq d < \infty \quad \text{on} \quad \Omega''
\]
where \(d, d\), and \(\| D\mathcal{U}\|_{C^1(\Omega'')}\) depend on \(\Omega, \Omega', H, \mathcal{W}(\mathcal{U}), \) and \(\| D\mathcal{U}\|_{L^p(\Omega)}\). Hence
\[
\| A_{jm}^m \|_{C^1(\Omega'')} = \left\| \frac{\partial^2 \sigma}{\partial F_{mn} \partial F_{ij}} (D\mathcal{U}) \right\|_{C^1(\Omega'')} \leq c_1.
\]
Moreover the strict-Legendre Hadamard condition holds:
\[
\sum_{i, j, m, n=1}^2 A_{jm}^m(X) \lambda_i \lambda_m \pi_j \pi_n \geq |\lambda|^2 |\pi|^2
\]
for all \(\lambda, \pi \in \mathbb{R}^2\). [See (1.5)] Thus we can apply the regularity theory for linear elliptic systems with Hölder continuous coefficients (see Proposition 2.1 and Theorem 3.2 of Chapter III in [6]) to conclude that \(\| v_m \|_{C^{1,2}(\Omega')} \leq c_2 \cdot \| v \|_{L^2(\Omega')}\) and hence
\[
\| \mathcal{U} \|_{C^{2,2}(\Omega')} \leq c_3 \cdot \| \mathcal{U} \|_{W^{1,2}(\Omega')}.
\]
Since \(\| D\mathcal{U} \|_{L^2(\Omega')}^2 \leq 2 \cdot \mathcal{W}(\mathcal{U})\), the theorem follows. □

**Theorem 5.4.** Let \(\mathcal{U}\) be a classical equilibrium solution and assume [in addition to (1.2)] that \(H \in C^{k,\beta}_{loc}(\mathbb{R}^+)\) where \(k \geq 2\) and \(0 < \beta < 1\). Then \(\mathcal{U} \in C^{k,\beta}_{loc}(\Omega)\) and for any \(\Omega' \subset \subset \Omega\)
\[
\| \mathcal{U} \|_{C^{k,\beta}(\Omega')} \leq c
\]

where $c$ depends on $k, \beta, \Omega, \Omega', H, \mathcal{W}(\mathcal{U}), \|\mathcal{U}\|_{L^2(\Omega)},$ and $\|D\mathcal{U}\|_{L^p(\Omega)}$ for $p = \max \left\{ 16, 12 + \frac{16}{s} \right\}$. 

**Proof.** Let $I$ be such that with $Q''$ as in the previous lemma. Note that if $\mathcal{U} \in C^{l, \beta}(\Omega'')$, $\mathbb{R}^2$ then $\mathcal{U} \in C^{l-1, \beta}(\Omega'')$.

By (5.8) and Theorem 3.3 of Chapter III in [6] it follows that

\[ \mathcal{U} \in C^{l, \beta}(\Omega'') \quad \text{for} \quad q = 1, 2 \quad \text{and} \]

\[ \|\mathcal{U}\|_{C^{l+1, \beta}(\Omega')} \leq c_l \]

where $c_l$ depends on $\Omega', \Omega'', \beta$, $H$, $l$ and $\|\mathcal{U}\|_{C^{l, \beta}(\Omega')}$. From Lemma 5.3 (for $l=0$) we have

\[ \|\mathcal{U}\|_{C^{1, \beta}(\Omega')} \leq c_0 \]

where $c_0$ depends on $\Omega, \Omega', H, \mathcal{W}(\mathcal{U}), \|\mathcal{U}\|_{L^2(\Omega)},$ and $\|D\mathcal{U}\|_{L^p(\Omega)}$. The assertion follows by iterating (5.9) on nested subdomains. □

**APPENDIX**

A. Let $\mathcal{A} = \{ \mathcal{U} \in W^{1,2}(\Omega; \mathbb{R}^2) : \det D\mathcal{U} > 0 \text{ a.e. in } \Omega \text{ and } \mathcal{W}(\mathcal{U}) < \infty \}$

where

\[ \mathcal{W}(\mathcal{U}) = \int_{\Omega} \gamma(D\mathcal{U}) \, d\mathcal{X} \]

and $\Omega$ is a bounded domain in $\mathbb{R}^2$. Assume $\mathcal{U} \in \mathcal{A}$ and $\gamma(F)$ is a differentiable function defined on $M^{2 \times 2}_+$. In general it is impossible to take a first variation of $\mathcal{W}$ at $\mathcal{U}$ with respect to a linear perturbation, that is, to obtain

\[ \frac{d}{d\varepsilon} \mathcal{W}(\mathcal{U} + \varepsilon \Phi) \big|_{\varepsilon=0} \]

for each $\varepsilon \neq 0$ the set $\{ X \in \Omega : D(\mathcal{U} + \varepsilon \Phi)(X) \notin M^{2 \times 2}_+ \}$ has positive measure. Hence $\mathcal{W}(\mathcal{U} + \varepsilon \Phi)$ is undefined for $\varepsilon \neq 0$. On the other hand, Ball observed that if one considers nonlinear perturbations which amount to deformations of the interior of $\Omega$, then under certain conditions on $\gamma$ the first variation is well defined. (See [2].)

We prove Ball’s result in Theorem A.1 below. In Lemma A.2 we check that the hypotheses of Ball’s theorem hold for

\[ \gamma(F) = \sigma(F) = \frac{1}{2} |F|^2 + H(\det F). \]

Finally in Theorem A.3, we show that equations (2.8) hold for weak equilibrium solutions when $\gamma = \sigma$. 

*Annales de l’Institut Henri Poincaré - Analyse non linéaire*
Let $\gamma$ satisfy the following hypotheses:

1. $\gamma \geq 0$ on $M^2_{+} \times 2$. 
2. $\gamma \in C^1(M^2_{+} \times 2)$. 
3. For some $\theta > 0$ there exists a constant $N$ such that 
   \[ |F^T \cdot D\gamma(FC)| \leq N \cdot [1 + \gamma(F)] \]
   for all $F, C \in M^2_{+} \times 2$ with $|C - I| \leq \theta$.

**Theorem A.1.** - Assume $\mathcal{U} \in \mathcal{A}$ and $\gamma$ satisfies (A.1). For each $\Phi \in C^1_0(\Omega; \mathbb{R}^2)$ there exists $\varepsilon_0 > 0$ so that $\mathcal{U}_\varepsilon(X) = \mathcal{U}(X + \varepsilon \cdot \Phi(X)) \in \mathcal{A}$ for $|\varepsilon| \leq \varepsilon_0$, $\frac{d}{d\varepsilon} \mathcal{W}(\mathcal{U}_\varepsilon)|_{\varepsilon=0}$ exists, and

\[ \frac{d}{d\varepsilon} \mathcal{W}(\mathcal{U}_\varepsilon)|_{\varepsilon=0} = \int_\Omega \left( -\gamma \cdot \delta_k^l + u_{xk} \cdot \frac{\partial \gamma}{\partial u_j^l} \right) \Phi_k^j dX \]

where $\gamma \equiv \gamma(D\mathcal{U})$, $(u^1, u^2) = \mathcal{U}$ and $(x_1, x_2) = X$. Moreover for each $j$ and $k$ with $1 \leq j, k \leq 2$ the term in parentheses is summable.

**Proof.** - Let $Z_\varepsilon = Z_\varepsilon(X) = X + \varepsilon \cdot \Phi(X)$. For $\varepsilon$ sufficiently small $Z_\varepsilon(\cdot)$ is a $C^1$ diffeomorphism from $\Omega$ onto itself. We begin by showing that $\mathcal{U}_\varepsilon = \mathcal{U}(Z_\varepsilon) \in \mathcal{A}$ for $\varepsilon$ small. Now $\mathcal{U}_\varepsilon \in W^{1,2}(\Omega; \mathbb{R}^2)$ and $\det D\mathcal{U}_\varepsilon(X) = \det [D\mathcal{U}(Z_\varepsilon(X))] \cdot \det DZ_\varepsilon(X)$.

Since $\mathcal{U} \in \mathcal{A}$ and $\det DZ_\varepsilon > 0$ in $\Omega$ for $\varepsilon$ sufficiently small we conclude that $\det D\mathcal{U}_\varepsilon > 0$ a.e. in $\Omega$. Thus $\mathcal{U}_\varepsilon \in \mathcal{A}$ if $\mathcal{W}(\mathcal{U}_\varepsilon) < \infty$ and $\varepsilon$ is sufficiently small, say $|\varepsilon| \leq \varepsilon_1$.

Now

\[ \mathcal{W}(\mathcal{U}_\varepsilon) = \int_\Omega \gamma(D\mathcal{U}_\varepsilon) dX \]
\[ = \int_\Omega \gamma(D\mathcal{U}(Z_\varepsilon)) \cdot DZ_\varepsilon(X) dX \]
\[ = \int_\Omega \gamma(D\mathcal{U}(Z)) \cdot DZ_\varepsilon(X_\varepsilon) \cdot \det DZ_\varepsilon^{-1} dZ \]

for $|\varepsilon| \leq \varepsilon_1$ where $X_\varepsilon = X_\varepsilon(Z) \equiv Z_\varepsilon^{-1}(Z)$ since $Z = Z_\varepsilon(X)$ is invertible and hence $X = Z_\varepsilon^{-1}(Z)$. Now chose $\varepsilon_0 \leq \varepsilon_1$ so that $|DZ_\varepsilon(X) - I| \leq \theta$ for all $|\varepsilon| \leq \varepsilon_0$ and all $X$ in $\Omega$, where $\theta$ is the constant defined in (A.1). Without loss of generality assume $\theta$ is so small that $|C + |C^{-1}| \leq 4$ whenever $|C - I| \leq \theta$. Thus $\frac{1}{16} \leq \det DZ_\varepsilon^{-1} \leq 16$ for $|\varepsilon| \leq \varepsilon_0$ and

\[ \mathcal{W}(\mathcal{U}_\varepsilon) \leq 16 \cdot \int_\Omega \gamma(D\mathcal{U}(Z)) \cdot DZ_\varepsilon(X_\varepsilon) dZ. \]
We bound this by estimating \( \gamma(FC) \) assuming \( |C-I| \leq \theta \). Note that
\[
\gamma(FC) - \gamma(F) = \int_0^1 \frac{d}{dt} [\gamma(F.C(t))] \, dt
\]
where \( C(t) = (1-t)I + tC \) and
\[
\left| \frac{d}{dt} [\gamma(F.C(t))] \right| = \sum_{i,j,k,l=1}^2 \frac{\partial \gamma}{\partial F_{ij}} (F.C(t)).F_{lk}.[C-I]_{kj}
\]
\[
= \sum_{k,j=1} |F^T.D\gamma(F.C(t))|_{kj}.[C-I]_{kj}
\]
\[
\leq |F^T.D\gamma(F.C(t))|.|C-I|.
\]
Since \( |C(t)-I| \leq \theta \) for \( 0 \leq t \leq 1 \) we have from (A.1) that
\[
|F^T.D\gamma(F.C(t))| \leq N.[1+\gamma(F)].
\]
Hence
\[
(A.4) \quad |\gamma(FC) - \gamma(F)| \leq N.|1+\gamma(F)|.|C-I|
\]
\[
\leq N\theta.[1+\gamma(F)].
\]
From this and (A.3) we have
\[
\mathcal{W}^-(\mathcal{U}) \leq M_1 \left[ \mathcal{W}^- (\mathcal{U}) + |\Omega| \right] < \infty
\]
for \( |\varepsilon| \leq \varepsilon_0 \) where \( M_1 \) is a fixed constant. Thus \( \mathcal{U}_\varepsilon \in \mathcal{A} \) when \( |\varepsilon| \leq \varepsilon_0 \).

Next consider
\[
\frac{1}{\varepsilon} [\mathcal{W}^- (\mathcal{U}_\varepsilon) - \mathcal{W}^- (\mathcal{U})]
\]
\[
= \frac{1}{\varepsilon} \int_\Omega \left[ \gamma(D\mathcal{U}(Z).DZ_\varepsilon(X_\varepsilon)) \cdot \det DZ_\varepsilon^{-1} - \gamma(D\mathcal{U}(Z)) \right] dZ
\]
\[
= \int_\Omega \left[ \frac{1}{\varepsilon} \gamma(D\mathcal{U}(Z).DZ_\varepsilon(X_\varepsilon)) - \gamma(D\mathcal{U}(Z)) \right] \cdot \det DZ_\varepsilon^{-1} dZ
\]
\[
+ \int_\Omega \gamma(D\mathcal{U}(Z)).\frac{1}{\varepsilon} \cdot [\det DZ_\varepsilon^{-1} - 1] dZ.
\]
We apply the dominated convergence theorem to let \( \varepsilon \to 0 \) in each of the above integrals. For the first integral recall that \( 0 < \det DZ_\varepsilon^{-1} \leq 16 \) and \( |DZ_\varepsilon - I| \leq \theta \) when \( |\varepsilon| \leq \varepsilon_0 \). From (A.4) we have
\[
\frac{1}{\varepsilon} [\gamma(D\mathcal{U}(Z).DZ_\varepsilon(X_\varepsilon)) - \gamma(D\mathcal{U}(Z))] \cdot \det DZ_\varepsilon^{-1} (Z)
\]
\[
\leq 16N.[1+\gamma(D\mathcal{U}(Z))].\frac{1}{\varepsilon} |DZ_\varepsilon(X_\varepsilon) - I|
\]
\[
\leq 16N.[1+\gamma(D\mathcal{U}(Z))].\|D\Phi\|_{L^\infty(\Omega)}
\]
where the right-hand side is integrable by hypothesis. Thus we can pass to the limit under the integral. To evaluate the limit we use (A.1) and the fact that $DZ_{\varepsilon} = I + \varepsilon \cdot D\Phi$. For any $F \in M^{2 \times 2}_+ \times X$ in $\Omega$, we have

$$\lim_{\varepsilon \to 0} \frac{1}{\varepsilon} [\gamma (F \cdot DZ_{\varepsilon}(X)) - \gamma (F)] = \frac{\partial \gamma}{\partial F_{ij}} (F) \cdot F_{ik} \cdot \Phi^k_{X_j} (X)$$

where the convergence is uniform for all $X$ in $\Omega$. Thus $X_{\varepsilon} \equiv Z_{-1} (Z) \to Z$ as $\varepsilon \to 0$ for each $Z$ in $\Omega$, we conclude that

$$\lim_{\varepsilon \to 0} \frac{1}{\varepsilon} [\gamma (F \cdot DZ_{\varepsilon}(X_{\varepsilon})) - \gamma (F)] = \frac{\partial \gamma}{\partial F_{ij}} (F) \cdot F_{ik} \cdot \Phi^k_{X_j} (Z)$$

for all $Z$ in $\Omega$. Hence

$$(A.5) \quad \lim_{\varepsilon \to 0} \int_{\Omega} \frac{1}{\varepsilon} [\gamma (D\mathcal{U} (Z) \cdot DZ_{\varepsilon}(X_{\varepsilon})) - \gamma (D\mathcal{U} (Z))] \cdot det DZ^{-1}_{\varepsilon} dZ = \int_{\Omega} \frac{\partial \gamma}{\partial u_{X_j}} (D\mathcal{U} (Z)) \cdot u_{x_k} (Z) \cdot \Phi^k_{X_j} (Z) dZ.$$

For the second integral we note that

$$\frac{1}{\varepsilon} [\det DZ_{\varepsilon}(X) - 1] \to \Phi^1_{x_1} (X) + \Phi^2_{x_2} (X) \quad as \varepsilon \to 0$$

where the convergence is uniform for all $X$ in $\Omega$. Thus

$$\frac{1}{\varepsilon} [\det DZ^{-1}_{\varepsilon} (Z) - 1] \to - [\Phi^1_{x_1} (Z) + \Phi^2_{x_2} (Z)] \quad as \varepsilon \to 0$$

for all $Z$ in $\Omega$ and

$$\lim_{\varepsilon \to 0} \int_{\Omega} \gamma (D\mathcal{U}) \cdot \frac{1}{\varepsilon} [\det DZ^{-1}_{\varepsilon} - 1] dZ = - \int_{\Omega} \gamma (D\mathcal{U}) \cdot [\Phi^1_{x_1} + \Phi^2_{x_2}] dZ.$$

From this and (A.5) we conclude that the first variation $\frac{d}{d\varepsilon} \mathcal{W} (\mathcal{U}_{\varepsilon}) |_{\varepsilon = 0}$ exists and it is given by (A.2).

Finally we point out that

$$\left( - \gamma \cdot \delta^i_k + u_{x_k} \cdot \frac{\partial \gamma}{\partial u_{x_j}} \right) \in L^1 (\Omega)$$

for each $j$ and $k$. Indeed, this is just $[ - \gamma \cdot I + D\mathcal{U}^T \cdot D\gamma (D\mathcal{U})]_{jk}$; from (A.1) with $C = I$ it follows that this is integrable if $\mathcal{W} (\mathcal{U}) < \infty$. □

Next we consider

$$\sigma (F) = \frac{|F|^2}{2} + H (\det F)$$
with $H$ as described in (1.2).

**Lemma A.2.** Let $\gamma(F) = \sigma(F)$ for all $F$ in $M^{2 \times 2}_+$. Then $\gamma$ satisfies (A.1).

**Proof.** By (1.2) properties (A.1)\textsubscript{1} and (A.1)\textsubscript{2} hold. Thus we need only to establish (A.1)\textsubscript{3}.

Choose $\theta > 0$ so that $|C| + |C^{-1}| \leq 4$ and $\frac{1}{4} \leq \det C \leq 4$ whenever $C \in M^{2 \times 2}_+ \text{ and } |C - I| \leq \theta$. We have

\[
D\sigma(F) = F + H'(\det F) \begin{bmatrix} F_{22} & -F_{21} \\ -F_{12} & F_{11} \end{bmatrix}
\]

for all $F$ in $M^{2 \times 2}_+$. Hence

\[
F^T \cdot D\sigma(F) = F^T F + (\det F) \cdot H'(\det F) \cdot I
\]

and

\[
F^T \cdot D\sigma(FC) = (C^T)^{-1} \cdot (FC)^T \cdot D\sigma(FC)
= (C^T)^{-1} \cdot [(FC)^T \cdot FC + (\det FC) \cdot H'(\det FC) \cdot I]
= F^T FC + \det C \cdot det F \cdot H'(\det C \cdot det F) \cdot (C^{-1})^T
\]

for all $C$ and $F$ in $M^{2 \times 2}_+ \text{ with } |C - I| \leq \theta$. It follows that

\[
F^T \cdot D\sigma(FC) | \leq M_1 \cdot (|F|^2 + \det C \cdot det F \cdot |H'(\det C \cdot det F)|)
\]

where $M_1$ is a fixed constant. Since $\det F \leq |F|^2$, (A.1)\textsubscript{3} follows if we prove: There exists $M_2 > 0$ depending on $H$ so that

\[
(A.6) \quad rd. |H'(rd)| \leq M_2 \cdot [1 + d + H(d)]
\]

whenever $\frac{1}{4} \leq r \leq 4$ and $d > 0$.

We prove this inequality in two cases, $\tau \neq -1$ and $\tau = -1$ where $\tau$ is defined in (1.2). Fix $r$ and $d$ as above and assume $\tau \neq -1$. By (1.2) and elementary calculus it follows that

\[
(A.7) \quad rd. |H'(rd)| \leq c_1 \cdot (d^{-s} + d^{s+2} + d)
\]

where $c_1$ depends on $H$. For $d$ sufficiently small or $d$ sufficiently large,

\[
d^{-s} + d^{s+2} \leq c_2 \cdot [1 + d + H(d)].
\]

Hence

\[
(A.8) \quad d^{-s} + d^{s+2} \leq c_3 \cdot [1 + d + H(d)]
\]

for all $d > 0$ where $c_3$ depends on $H$. By (A.7) and (A.8) we have (A.6) in the case $\tau \neq -1$.

If $\tau = -1$ we note that by (1.2) and elementary calculus,

\[
rd. |H'(rd)| \leq c_4 \cdot [d^{-s} + d \cdot (\ln d)^+ + d]
\]
and
\[ d^{-\varepsilon} + d \cdot (\ln d)^+ \leq c_5 \cdot [1 + d + H(d)] \]
for all \( d > 0 \) and \( \frac{1}{4} \leq \tau \leq 4 \) where \( c_5 \) depends on \( H \). Hence (A.6) holds in the case \( \tau = -1 \).

Finally we point out the specific form of our equations when
\[ \gamma(F) = \sigma(F) = \frac{|F|^2}{2} + H(\det F). \]

**Theorem A.3.** Assume \( U \in \mathcal{A} \), \( \gamma = \sigma \), and \( \frac{d}{dc} \mathcal{W}(U_c) \bigr|_{c=0} = 0 \). Then \( U \) satisfies (2.8).

**Proof.** By (A.2) of Theorem A.1 we have
\[ \left[ -\sigma(DU) \cdot \delta_i^k + u^i_{,k} \cdot \frac{\partial \sigma}{\partial u_{ij}} (DU) \right]_{x_j} = 0 \]
for \( k = 1, 2 \). This can be expressed as
\[ \text{div} \left[ -\sigma(DU) \cdot I + DU^T \cdot D\sigma(DU) \right] = 0. \]
Since
\[ \sigma(F) = \frac{|F|^2}{2} + H(\det F) \]
and
\[ F^T \cdot D\sigma(F) = F^T F + \det F \cdot H'(\det F) \cdot I, \]
we have
\[ \text{div} \left[ \left( -\frac{|DU|^2}{2} \cdot I + DU^T \cdot DU \right) + (-H(d) + d \cdot H'(d)) \cdot I \right] = 0 \]
where \( d = \det DU \). Setting \( f(d) = -H(d) + d \cdot H'(d) \) and \( (u, v) = \mathcal{U} \) we get
\[ \left[ \frac{u_x^2 + v_x^2 - u_y^2 - v_y^2}{2} + f(d) \right]_{x} + [u_x u_y + v_x v_y]_{x} = 0 \]
and
\[ [u_x u_y + v_x v_y]_{x} + \left[ \frac{u_y^2 + v_y^2 - u_x^2 - v_x^2}{2} + f(d) \right]_{y} = 0. \]

**B.** In this section we prove the following result which was used in the proof of Lemma 5.1.

THEOREM B.1. Assume \( u \in W^{2,2}(\Omega), \ B_{2r}(X_0) \ni B_{2r} \subset \Omega, \) and 
\( \eta \in C^1_0(B_{2r}) \) with \( \nabla \eta \leq \frac{c_0}{r} \) on \( B_r \). Then

\[
\int_{B_{2r}} (\Delta u)^2 \cdot \eta^2 \, dx \geq \frac{1}{2} \int_{B_{2r}} |D^2 u|^2 \cdot \eta^2 \, dx - \frac{c_1}{r^2} \int_{B_{2r}} \left| \nabla u - \nabla u_{X_0, 2r} \right|^2 \, dx
\]

where \( c_1 \) depends only on \( c_0 \).

Proof. By approximation we may assume that \( u \in C^3(B_{2r}) \). Consider 
\( (\Delta u)^2 = \sum_{i,j} u_{x_i x_j} u_{x_i x_j} \). Integrating by parts twice, we have

\[
\int_{B_{2r}} u_{x_i x_j} u_{x_i x_j} \eta^2 \, dx = \int_{B_{2r}} - u_{x_i}(u_{x_i x_j} \cdot \eta^2 + u_{x_j x_j} \cdot 2 \eta \cdot \eta_{x_i}) \, dx
\]

\[
= \int_{B_{2r}} [u_{x_i x_j} \cdot (u_{x_i x_j} \cdot \eta^2 + u_{x_j x_j} \cdot 2 \eta \cdot \eta_{x_i}) - u_{x_i} \cdot u_{x_j x_j} \cdot 2 \eta \cdot \eta_{x_i}] \, dx
\]

\[
\geq \int_{B_{2r}} u_{x_i x_j}^2 \eta^2 \, dx - 4 \int_{B_{2r}} |D^2 u| \cdot \eta \cdot |\nabla u| \cdot \frac{c_0}{r} \, dx
\]

for any \( i \) and \( j \). Hence for any \( \varepsilon > 0 \).

\[
\int_{B_{2r}} u_{x_i x_i} u_{x_j x_j} \eta^2 \, dx \geq \int_{B_{2r}} u_{x_i x_j}^2 \eta^2 \, dx
\]

\[
- 2 \varepsilon \int_{B_{2r}} |D^2 u|^2 \cdot \eta^2 \, dx - \frac{2 \varepsilon}{r^2} \left( \frac{c_0}{r} \right)^2 \int_{B_{2r}} |\nabla u|^2 \, dx.
\]

Summing on \( i \) and \( j \) we have

\[
\int_{B_{2r}} (\Delta u)^2 \cdot \eta^2 \, dx \geq (1 - 8 \varepsilon) \int_{B_{2r}} |D^2 u|^2 \cdot \eta^2 \, dx - \frac{8 \varepsilon}{r^2} \left( \frac{c_0}{r} \right)^2 \int_{B_{2r}} |\nabla u|^2 \, dx.
\]

Setting \( \varepsilon = \frac{1}{16} \) we obtain

\[
\text{(B. 1)} \int_{B_{2r}} (\Delta u)^2 \cdot \eta^2 \, dx \geq \frac{1}{2} \int_{B_{2r}} |D^2 u|^2 \cdot \eta^2 \, dx - \frac{128 \cdot c_0^2}{r^2} \int_{B_{2r}} |\nabla u|^2 \, dx.
\]
Now let $w(X) = u(X) - \langle X, \nabla u_{X_0, 2r} \rangle$. Then $D^2 w = D^2 u$ and $\nabla w = \nabla u - \nabla u_{X_0, 2r}$. Applying (B.1) to $w$ we get
\[
\int_{B_{2r}} (\Delta u)^2 \cdot \eta^2 \, dX \\
\quad \geq \frac{1}{2} \int_{B_{2r}} |D^2 u|^2 \cdot \eta^2 \, dX - \frac{128 \cdot c_0^2}{r^2} \int_{B_{2r}} |\nabla u - \nabla u_{X_0, 2r}|^2 \, dX
\]
which proves our assertion. □
