ABSTRACT. – In this paper we are interested in the study of a model of nonhomogeneous diphasic incompressible flow. More precisely we consider a coupling of a Cahn–Hilliard and an incompressible Navier–Stokes equations where the densities of the phases are different.

For this general model we can only show the local existence of a unique very regular solution and the existence of weaker solutions is still an open problem. But, if we look at the behavior of the system when the densities tends to be equal (slightly nonhomogeneous case), we show the existence of a global weak solution and of a unique local strong solution (which is in fact global in 2D). Finally, an asymptotic stability result for the metastable states is shown in this slightly nonhomogeneous case.

Keywords: Nonhomogeneous Navier–Stokes equation; Cahn–Hilliard equation
AMS classification: 76D05; 35Q30; 76T99

RÉSUMÉ. – Dans cet article, nous nous intéressons à l’étude d’un modèle d’écoulement diphasique nonhomogène incompressible. Plus précisément, nous considérons un couplage entre une équation de Cahn–Hilliard et une équation de Navier–Stokes incompressible dans lesquelles les densités des deux phases sont différentes.

Pour ce modèle général, nous pouvons seulement prouver l’existence locale et l’unicité d’une solution très régulière, l’existence de solutions plus faibles restant un problème ouvert. En revanche, si nous considérons le comportement du système quand les densités des deux phases sont proches (cas faiblement nonhomogène), nous montrons l’existence de solutions faibles globales et l’existence et l’unicité de solutions fortes locales (en fait globales en dimension 2). Enfin, un résultat de stabilité asymptotique des états métastables est établi, toujours dans le cas faiblement nonhomogène. © 2001 Éditions scientifiques et médicales Elsevier SAS

1. Introduction

We are interested in the study of incompressible diphasic nonhomogeneous mixtures flows. We have proposed in [6] the derivation of a mathematical model for this kind of problem based on the coupling of a Cahn–Hilliard equation and a nonhomogeneous Navier–Stokes equation. The origine of this derivation lies on the works of numerous

E-mail address: fboyer@math.u-bordeaux.fr (F. Boyer).
We obtain the following equations for the order parameter \( \varphi \), the potential \( \mu \) and the velocity \( v \). If \( \rho_1^0, \rho_2^0 \) denote the densities of the two phases, the system reads

\[
\begin{align*}
\frac{\partial \varphi}{\partial t} + v \cdot \nabla \varphi - \text{div} \left( \frac{1}{\rho_e(\varphi)} \nabla \left( \frac{\mu}{\rho_e(\varphi)} \right) \right) &= 0, \\
\mu &= -\alpha \Delta \varphi + F'(\varphi), \\
\rho_e(\varphi) \left( \frac{\partial v}{\partial t} + v \cdot \nabla v \right) - 2 \text{div} (\eta(\varphi) D(v)) + \nabla p &= \mu \nabla \varphi + \varepsilon \left( 1 - \frac{\varphi^2}{4} \right) + \rho_e(\varphi) g, \\
\text{div}(v) &= 0,
\end{align*}
\]

the normalized density being theoretically given by

\[
\rho_e(\varphi) = 1 + \varepsilon \frac{\varphi - 1}{2},
\]

with

\[
\varepsilon = \frac{|\rho_1^0 - \rho_2^0|}{\max(\rho_1^0, \rho_2^0)},
\]

representing the relative difference of the densities. Let us remark that we always have \( \varepsilon \leq 1 \). We recall the usual notation for the deformation tensor \( D(u) = (\nabla u + \nabla u^t)/2) \).

For this model, we are not able to prove in general (even if \( \varepsilon = 0 \)) that the values of the order parameter remain in the physical-meaningful interval \([-1, 1]\). This implies that if we define \( \rho_e \) with (1.5) we are not sure that the density remains always positive. That’s the reason why, we introduce a slightly different definition for \( \rho_e \), namely it must be a function satisfying:

\[
\rho_e(1) = 1, \quad |\rho_e'|_{\infty} \leq \varepsilon
\]

and

\[
0 < \rho_1 \leq \rho_e(\varphi) \leq \rho_2,
\]

independently of \( \varepsilon \). One may keep in mind that \( \rho_e \) is essentially given by (1.5) into the interval \([-1, 1]\).

In some particular cases, for example (see [5]) if \( \varepsilon = 0 \) and if we introduce a degenerate mobility (diffusion coefficient) in the model, then we can show that the values of the order parameter stay in the physical-meaningful interval \([-1, 1]\). Hence, we know \textit{a posteriori} that the density is really given by (1.5). Such a qualitative result on the values of \( \varphi \) is also expected even in the case \( \varepsilon > 0 \), if one consider a logarithmic Cahn–Hilliard potential \( F \) of the form

\[
F(\varphi) = \theta (1 - \varphi^2) + (1 + \varphi) \log(1 + \varphi) + (1 - \varphi) \log(1 - \varphi),
\]

which is a physical-relevant choice for \( F \) (see [14]).
From now on, we suppose that the dimension of the space is $d = 2$ or $d = 3$. Our following study takes place again [5] in the case of the channel under shear which corresponds to the physical experimental conditions, but our results are still true if we consider a bounded regular domain with homogeneous boundary conditions. Consequently, the previous system is provided with periodicity condition in the $x, y$-directions and on the other boundaries, with the conditions

\[ \frac{\partial \varphi}{\partial \nu} = \frac{\partial \mu}{\partial \nu} = 0, \]  

(1.6)

\[ v = U e_x \text{ on } \{z = 1\}, \quad v = -U e_x \text{ on } \{z = -1\}. \]  

(1.7)

We shown in [6] that the numerical simulations for this model give physical-relevant results. Moreover, the homogeneous case ($\varepsilon = 0$, $\rho_{\varepsilon}(\varphi) \equiv 1$) has been studied in [5], where it is shown the existence of weak solutions, the existence and uniqueness of strong solutions and an asymptotic stability result of the metastable states of the potential.

Our first objective is to study the existence of solutions to system (1.1)–(1.4), (1.6), (1.7). For any range of admissible values of $\varepsilon$, we can only show (Theorem 3.1) the existence and uniqueness of local very strong solutions. In this case, the existence of weak solutions is still an open question.

Nevertheless, in the slightly nonhomogeneous regime, that is to say if we suppose the smallness of the parameter $\varepsilon$, we can drastically improve the results in this direction. More precisely, we show (Theorem 3.2) that if $\varepsilon$ is small enough, then there exists a global weak solution uniformly bounded in time in the appropriate spaces. Furthermore, this solution converges, up to an extraction of a subsequence, towards a weak solution of the homogeneous problem.

Moreover we show (Theorem 3.3), always under the condition that $\varepsilon$ is small enough, the existence and uniqueness of strong solutions (global in 2D and local in 3D) for regular initial data.

Finally, we establish (Theorem 3.4) the same kind of asymptotic stability result than the one shown in [5], always in the slightly nonhomogeneous case. We point out that the asymptotic stability of the metastable stationary states is shown even in 3D.
2. Notations and fundamental results

Functional spaces

Throughout this paper we denote by $|.|_p$ the usual norm on the space $L^p$, and by $\|\|_s$ the usual norm on $H^s$. We let $L^p = (L^p)^d$ and $H^s = (H^s)^d$ the norms on these spaces being always denoted by $|.|_p$ and $\|\|_s$.

We have to introduce the natural homogeneous boundary conditions associated to the problem (1.1)–(1.4), (1.6), (1.7). Namely, we introduce, if it makes sense, the conditions

\[ \varphi \text{ is periodic in the } x, y\text{-directions and satisfies } \frac{\partial \varphi}{\partial \nu} = \frac{\partial \Delta I \varphi}{\partial \nu} = 0 \text{ on } \{z = \pm 1\}. \quad (2.1) \]

\[ u \text{ is periodic in the } x, y\text{-directions and satisfies } u = 0 \text{ on } \{z = \pm 1\}. \quad (2.2) \]

Then we define classically (see [5]) the spaces

\[ \Phi_s = \{ \varphi \in H^s, \text{ satisfying } (2.1) \}, \]

\[ V_s = \{ u \in H^s, \text{div}(u) = 0, \text{ satisfying } (2.2) \}. \]

As usual, the space $V_0$ will be denoted by $H$, and the space $V_1$ by $V$. In the definition of $H$ one must replace the boundary condition $u = 0$ by $u = 0$. Moreover, we will denote by $P$ the orthogonal projector in $L^2(\Omega)$ onto the space $H$.

Stokes operator

We recall (see [26]) that for any $u \in V_2$, there exists a unique $(Au, \pi) \in H \times (H^1/\mathbb{R})$ such that

\[ \begin{aligned} Au &= -\Delta u + \nabla \pi, \\
\end{aligned} \]

the operator $u \mapsto Au$ is a nonbounded operator in $H$ of domain $V_2$ named the Stokes operator. Moreover, there exists $C_1, C_2, C_3 > 0$ such that for any $u \in V_2$ we have

\[ \begin{cases} C_1 \|u\|_2 \leq |Au|_2 \leq C_2 \|u\|_2, \\
\|\pi\|_{H^1/\mathbb{R}} \leq C_3 \|u\|_2, \\
|\pi|_{L^2/\mathbb{R}} \leq C_3 \|u\|_1. \end{cases} \quad (2.3) \]

Fundamental inequalities

We do not recall the classical Sobolev embeddings that we will use in this paper. We also refer to [3,18] for the different interpolation results we need in our estimates.

Let us recall the Poincaré’s and Korn’s inequalities: there exists $C_4, C_5 > 0$ such that for any $u \in V$, we have

\[ C_4 \|u\|_1 \leq |\nabla u|_2 \leq C_5 |D(u)|_2. \quad (2.4) \]
Furthermore, for any \( f \in L^1 \) we denote by \( m(f) = \frac{1}{|\Omega|} \int_{\Omega} f \) its average. Then [25] there exists \( C_6 > 0 \) such that

\[
\begin{aligned}
\| \varphi - m(\varphi) \|_1 &\leq C_6 |\nabla \varphi|_2, \quad \forall \varphi \in \Phi_1, \\
\| \varphi - m(\varphi) \|_{s+2} &\leq C_6 |\Delta \varphi|_s, \quad \forall s \geq 0, \forall \varphi \in \Phi_{s+2}.
\end{aligned}
\] (2.5)

As a consequence we will systematically use inequalities like

\[
\| \nabla \varphi \|_1 = \| \nabla (\varphi - m(\varphi)) \|_1 \leq \| \varphi - m(\varphi) \|_2 \leq C_6 |\Delta \varphi|_2.
\]

Finally we will use the two following Agmon’s inequalities in dimension \( d = 3 \)

\[
\begin{aligned}
|f|_\infty &\leq C \| f \|^1_1 \| f \|^1_2, \quad \text{for any } f \in H^2, \\
|f|_\infty &\leq C \| f \|^1_2 \| f \|^1_3, \quad \text{for any } f \in H^3.
\end{aligned}
\] (2.6)

**Stationary solutions**

One can remark that, if we suppose that \( g \) is derived from a potential \( G \), that is to say \( g = \nabla G \), then we can construct a family of stationary solutions of (1.1)–(1.4)

\[
\varphi^\infty = \omega, \quad v^U = U z e_s,
\] (2.7)

where \( \omega \) is a given constant. We will study the asymptotic stability of this solution in the Section 3.3, but introducing these solutions is necessary in order to state precisely the results we present here.

**Mean conservation for the Cahn–Hilliard equation**

We state here a fundamental property of the Cahn–Hilliard equation and more generally of Eq. (1.1) with the boundary conditions (1.6).

**Lemma 2.1.** Any solution \( \varphi \) of (1.1) satisfying (1.6), with a velocity field \( v(t) \in H \), satisfies

\[
\frac{\partial}{\partial t} m(\varphi) = 0,
\]

which implies that

\[
m(\varphi(t)) = m(\varphi_0), \quad \text{as long as } \varphi \text{ exists}.
\]

The proof is straightforward by choosing the constant function 1 as a test function for (1.1). We will use this property systematically in the following.

**General assumptions**

To conclude with, we make precise here the assumptions we make in the whole paper. First, we assume that the external forces term \( g \) lies in \( L^2 \) and is independent of the time. In some sections, we will suppose in addition that \( g \) is a gradient of a potential of \( H^1 \).
Furthermore, we assume that the viscosity $\eta$ is a regular function (typically of $C^1$-class) which satisfies

$$0 < \eta_1 \leq \eta(x) \leq \eta_2, \quad \text{for any } x \in \mathbb{R}. $$

As far as the Cahn–Hilliard potential is concerned, we make the following assumptions (see [5])

$$F \text{ is of } C^2 \text{ class, and } F \geq 0, \quad (2.8)$$

$\exists F_1, F_2 > 0$ such that $|F'(x)| \leq F_1 |x|^p + F_2, \ |F''(x)| \leq F_1 |x|^{p-1} + F_2, \ \forall x \in \mathbb{R},$

where $1 \leq p \leq 3$ if $d = 3$ and $1 \leq p < +\infty$ if $d = 2,$ (2.9)

$$\forall \gamma \in \mathbb{R}, \ \exists F_3(\gamma) > 0, \ F_4(\gamma) \geq 0 \text{ such that,}$$

$$(x - \gamma) F'(x) \geq F_3(\gamma) F(x) - F_4(\gamma), \ \forall x \in \mathbb{R}, \quad (2.10)$$

$\exists F_5 \geq 0$ such that $F''(x) \geq -F_5, \ \forall x \in \mathbb{R}.$ (2.11)

As a remark, we point out that the condition $F \geq 0$ is not restrictive because a physical-meaningful potential is always bounded from below and adding a constant to the potential $F$ does not change the equations.

Those assumptions allows the choice of a classical Cahn–Hilliard potential: polynomial of second order with positive dominant coefficient (see [12,25]).

3. Slightly nonhomogeneous mixtures

In the case of general nonhomogeneous mixtures we can only show a result of local existence of strong solutions. In fact, the solutions we obtain are stronger than the one obtained in the sequel (Theorem 3.3). This is not surprising because, when we do not suppose that $\varepsilon$ is small, our system of Eqs. (1.1)–(1.4) is very strongly non-linear in particular in the Cahn–Hilliard equation (1.1). We give without proof the following result

**THEOREM 3.1.** – For any $U > 0$, $v_0 \in v_\infty^U + V$ and $\varphi_0 \in \Phi_4$, there exists a time $T > 0$ depending on $U$, $\|v_0\|_1$ and $\|\varphi_0\|_4$ such that for any $\varepsilon \leq 1$ there exists a unique strong solution $(\varphi_\varepsilon, v_\varepsilon)$ of the problem (1.1)–(1.4) on $[0, T[$, satisfying

$$\|\varphi_\varepsilon\|_{L^\infty(0, T; \Phi_4)} + \|\varphi_\varepsilon\|_{L^2(0, T; \Phi_4)} + \|v_\varepsilon - v_\infty^U\|_{L^\infty(0, T; V)} + \|v_\varepsilon - v_\infty^U\|_{L^2(0, T; V_2)} \leq C,$$

$$\left\| \frac{\partial \varphi_\varepsilon}{\partial t} \right\|_{L^2(0, T; \Phi_4)} + \left\| \frac{\partial v_\varepsilon}{\partial t} \right\|_{L^2(0, T; H)} \leq C,$$

where $C > 0$ is independent of $\varepsilon$.

**Remark 3.1.** – The proof consists essentially in using slightly differently the same estimates than in the proofs of Theorems 3.2 and 3.3.
In order to prove more significant results, we are interested, until the end of the paper, in the study of the system (1.1)–(1.4) when the parameter $\varepsilon$ is small. That is to say that we suppose that the densities of the two phases are close enough. Under those conditions we can show the existence of global weak solutions and the existence and uniqueness of strong solutions (global in 2D and local in 3D).

### 3.1. Weak solutions

In this subsection we are concerned with the proof of the following result.

**Theorem 3.2.** Let $U > 0$, $v_0^\varepsilon \in vU_\infty + H$, $\varphi_0^\varepsilon \in \Phi_3$, such that $m(\varphi_0^\varepsilon)$ is independent of $\varepsilon$. We suppose that there exists $C_0$ independent of $\varepsilon$ satisfying

$$\|\varphi_0^\varepsilon\|_1 + \|v_0^\varepsilon\|_2 + \varepsilon^{1/2}\|\varphi_0^\varepsilon\|_2 + \varepsilon^{3/4}\|\varphi_0^\varepsilon\|_3 \leq C_0.$$  

There exists $\varepsilon_0$ depending only on $C_0$, $U$ and $F$ such that for any $\varepsilon < \varepsilon_0$ there exists a weak solution $(\varphi_\varepsilon, v_\varepsilon)$ of (1.1)–(1.4) on $\mathbb{R}^+$ for the initial data $(\varphi_0^\varepsilon, v_0^\varepsilon)$, satisfying

$$\|\varphi_\varepsilon\|_{L^\infty(\mathbb{R}^+; \Phi_1)} + \varepsilon^{1/2}\|\varphi_\varepsilon\|_{L^\infty(\mathbb{R}^+; \Phi_2)} + \varepsilon^{3/4}\|\varphi_\varepsilon\|_{L^\infty(\mathbb{R}^+; \Phi_3)} + \|v_\varepsilon - vU_\infty\|_{L^\infty(\mathbb{R}^+; H)} \leq C,$$  

(3.1)

$$\|\varphi_\varepsilon\|_{L^2(t_0, t_0 + \tau; \Phi_3)} + \varepsilon^{1/2}\left\| \frac{\partial \varphi_\varepsilon}{\partial t} \right\|_{L^2(t_0, t_0 + \tau; L^2)} + \varepsilon^{3/4}\left\| \frac{\partial \varphi_\varepsilon}{\partial t} \right\|_{L^2(t_0, t_0 + \tau; H^1)}$$

$$+ \|\mu_\varepsilon\|_{L^2(t_0, t_0 + \tau; \Phi_1)} + \|v_\varepsilon - vU_\infty\|_{L^2(t_0, t_0 + \tau; V)} \leq C(\tau), \quad \text{for any } t_0 \geq 0, \tau > 0,$$  

(3.2)

$$\left\| \frac{\partial \rho_\varepsilon \cdot v_\varepsilon}{\partial t} \right\|_{L^2(0, T; V_{d/2})} \leq M(T),$$  

(3.3)

where $C$, $C(\tau)$, $M(T)$ are independent of $\varepsilon$ and $t_0$.

Moreover, if

$$\varphi_0^\varepsilon \rightarrow \varphi_0 \quad \text{and} \quad v_0^\varepsilon \rightarrow v_0, \quad \text{when } \varepsilon \rightarrow 0,$$

then, up to an extraction of a subsequence, $(v_\varepsilon, \varphi_\varepsilon)$ converges towards a solution of the homogeneous limit system ($\varepsilon = 0$).

**Remark 3.2.** The following proof is given in the case $d = 3$. The estimates in the 2D case are made in the same way but are in fact much easier to derive. As an exception, we point out the difference between the 2D and 3D case for inequalities (3.28) and (3.29).

**Proof.** In the following, it is convenient to drop the superscript $\varepsilon$ for $\varphi_0^\varepsilon, v_0^\varepsilon$ and the subscript $\varepsilon$ for $\varphi_\varepsilon, v_\varepsilon$ and $\rho_\varepsilon$, but one may keep in mind that any quantity which is estimated may depend on $\varepsilon$.

We will only give the formal derivation of the energy estimates (3.1)–(3.3). The complete proof can be performed through an approximation process (a Galerkin method, for example, [5]) and we will make precise at the end of the proof, the way we obtain the compactness necessary to take the limit in the approximated solutions.

From now on, we are mainly concerned with the proof of estimates (3.1), (3.2).
Step 1. Following [20], for \(\lambda > 0\) we introduce a vector field \(v_\lambda\) as in [5] depending only in \(z\) and satisfying:
\[
\begin{align*}
\text{div}(v_\lambda) &= 0, \\
v_\lambda \cdot \nabla v_\lambda &= 0, \\
|v_\lambda|_\infty &= 1, \\
|v_\lambda|_4 &\leq C\lambda, \\
|\nabla v_\lambda|^2 &\leq C\lambda^4 (1 + \lambda^8),
\end{align*}
\]
and
\[
v_\lambda = e_x \text{ on } \{z = 1\}, \quad v_\lambda = -e_x \text{ on } \{z = -1\}.
\]

Now we let \(v = u + Uv_\lambda\) so that \(u\) satisfies homogeneous boundary conditions (2.2) and the equations
\[
\begin{align*}
\partial_{\varphi} \frac{\partial\varphi}{\partial t} + u \cdot \nabla \varphi - \text{div} \left( \frac{1}{\rho} \nabla \left( \frac{\mu}{\rho} \right) \right) &= -U v_\lambda \cdot \nabla \varphi, \quad (3.5) \\
\mu &= -\alpha \Delta \varphi + F'(\varphi), \quad (3.6) \\
\rho \left( \frac{\partial u}{\partial t} + u \cdot \nabla u \right) - 2 \text{div} (\eta(\varphi) D(u)) + \nabla p &= -U \rho v_\lambda \cdot \nabla u - U \rho u \cdot \nabla v_\lambda + 2U \text{div} (\eta(\varphi) D(v_\lambda)) + \mu \nabla \varphi + \frac{1}{4} \nabla \left( \frac{\mu}{\rho} \right) + \rho g, \quad (3.7) \\
\text{div}(u) &= 0. \quad (3.8)
\end{align*}
\]

Just as in the remaining of this paper, we have denoted by \(\rho\) the density \(\rho(\varphi)\).

Step 2. We first try to get classical energy estimates for these equations. We take the inner product of (3.5) in \(L^2\) with \(\mu\) and of (3.7) in \(L^2\) with \(u\), and we get
\[
\begin{align*}
\frac{d}{dt} \left( \frac{\alpha}{2} |\nabla \varphi|^2 + \frac{1}{2} \sqrt{\rho} |u|^2 + \int_{\Omega} F(\varphi) \right) + 2 \int_{\Omega} \eta(\varphi) |D(u)|^2 + \int_{\Omega} \frac{1}{\rho^2} |\nabla \mu|^2 \\
= \int_{\Omega} \mu \frac{\rho'(\varphi)}{\rho^3(\varphi)} \nabla \varphi \cdot \nabla \mu + \frac{\rho}{4} \int_{\Omega} (1 - \varphi^2) \nabla \left( \frac{\mu}{\rho} \right) \cdot u + \int_{\Omega} \rho g \cdot u \\
+ \frac{1}{2} \int_{\Omega} |u|^2 \left( \frac{\partial \rho}{\partial t} + u \cdot \nabla \rho \right) - U \int_{\Omega} (v_\lambda \cdot \nabla \varphi) \mu \\
- U \int_{\Omega} \rho (u, \nabla v_\lambda) u - U \int_{\Omega} (v_\lambda \cdot \nabla u) u + 2U \int_{\Omega} \eta(\varphi) D(v_\lambda) : D(u).
\end{align*}
\]

Remark 3.3. – One can easily see that this last estimate is useless if we do not have an estimate for \(\partial \varphi/\partial t\). In fact, this point is the main difference in comparison with the classical nonhomogeneous fluids model [19,24]: as our model takes into account
exchange phenomena at the interface, the density does not satisfy the local conservation equation

\[ \frac{\partial \rho}{\partial t} + v \cdot \nabla \rho = 0, \]

so that we have

\[ \int_\Omega \left( \rho \left( \frac{\partial u}{\partial t} + u \cdot \nabla u \right) \right) \cdot u \, d\Omega = \frac{1}{2} \frac{\partial}{\partial t} \left( \int_\Omega |u|^2 \right) - \frac{1}{2} \int_\Omega |u|^2 \left( \frac{\partial \rho}{\partial t} + u \cdot \nabla \rho \right), \]

where the last term does not vanish.

Nevertheless, we have global conservation of the order parameter (and of the density if it is defined by (1.5)) in the sense that (Lemma 2.1)

\[ \frac{\partial}{\partial t} \left( \int_\Omega \varphi \right) = 0. \]

That’s the reason why we have to multiply (3.5) by \( \frac{\partial \varphi}{\partial t} \) to get after integration

\[
\left| \frac{\partial \varphi}{\partial t} \right|^2 + \int_\Omega (u \cdot \nabla \varphi) \frac{\partial \varphi}{\partial t} + U \int_\Omega (v \cdot \nabla \varphi) \frac{\partial \varphi}{\partial t} \\
= - \int_\Omega \frac{1}{\rho} \nabla \left( \frac{\mu}{\rho} \right) \cdot \nabla \frac{\partial \varphi}{\partial t} \\
= - \alpha \int_\Omega \frac{1}{\rho^2} \Delta \varphi \Delta \frac{\partial \varphi}{\partial t} - \alpha \int_\Omega \frac{\rho'(\varphi)}{\rho^3(\varphi)} \Delta \varphi \nabla \varphi \cdot \nabla \frac{\partial \varphi}{\partial t} - \int_\Omega \frac{1}{\rho} \nabla \left( \frac{F'(\varphi)}{\rho(\varphi)} \right) \cdot \nabla \frac{\partial \varphi}{\partial t} \\
= - \frac{d}{dt} \left( \frac{\alpha}{2} \int_\Omega \frac{1}{\rho^2} |\Delta \varphi|^2 \right) + \alpha \int_\Omega |\Delta \varphi|^2 \frac{\rho'(\varphi)}{\rho^3(\varphi)} \frac{\partial \varphi}{\partial t} \\
- \alpha \int_\Omega \frac{\rho'(\varphi)}{\rho^3(\varphi)} \Delta \varphi \nabla \varphi \cdot \nabla \frac{\partial \varphi}{\partial t} - \int_\Omega \frac{1}{\rho} \nabla \left( \frac{F'(\varphi)}{\rho(\varphi)} \right) \cdot \nabla \frac{\partial \varphi}{\partial t}. \tag{3.10}
\]

We see another time that this last estimate requires to have some information concerning \( \nabla \frac{\partial \varphi}{\partial t} \). In this direction, we multiply (3.5) by \( \frac{\partial \varphi}{\partial t} \) and integrate on \( \Omega \) to have

\[
\frac{1}{2} \frac{d}{dt} \left( \int_\Omega \frac{1}{\rho} \nabla \left( \frac{\mu}{\rho} \right) \right)^2 + \int_\Omega u \cdot \nabla \varphi \frac{\partial}{\partial t} \left( \frac{\mu}{\rho} \right) + U \int_\Omega (v \cdot \nabla \varphi) \frac{\partial}{\partial t} \left( \frac{\mu}{\rho} \right) \\
= - \int_\Omega \frac{\partial \varphi}{\partial t} \frac{\partial}{\partial t} \left( \frac{\mu}{\rho} \right) - \int_\Omega \frac{\rho'(\varphi)}{\rho^2(\varphi)} \nabla \left( \frac{\mu}{\rho} \right)^2 \frac{\partial \varphi}{\partial t} \\
= \alpha \int_\Omega \frac{\partial \varphi}{\partial t} \frac{\partial}{\partial t} \left( \frac{\Delta \varphi}{\rho} \right) - \int_\Omega \frac{\partial \varphi}{\partial t} \frac{\partial}{\partial t} \left( \frac{F'(\varphi)}{\rho(\varphi)} \right) - \int_\Omega \frac{\rho'(\varphi)}{\rho^2(\varphi)} \nabla \left( \frac{\mu}{\rho} \right)^2 \frac{\partial \varphi}{\partial t}. 
\]
We use assumptions (2.8)–(2.11) on the function \( F \), to deduce (see [5])

\[
C F_4(m(\varphi_0)) + \frac{1}{\rho_2^2} |\nabla \mu|_2^2 \geq \frac{1}{2 \rho_2^2} |\nabla \varphi|_2^2 + C |\nabla \varphi|_2^2 + C |\Delta \varphi|_2^2 + C F_3(m(\varphi_0)) \left( \int_{\Omega} F(\varphi) \right),
\]

and

\[
|m(\mu)| = \left| -\alpha \int_{\Omega} \Delta \varphi + \int_{\Omega} F'(\varphi) \right| \leq C (1 + |\varphi|_p^p) \leq C (1 + |\nabla \varphi|_2^2),
\]

because in any cases \( H^1 \subset L^p \). Finally we have

\[
\frac{1}{4} \left| \nabla \left( \frac{\mu}{\rho} \right) \right|_2^2 \leq \frac{1}{4 \rho_2^2} |\nabla \mu|_2^2 + C \varepsilon^2 |\mu \nabla \varphi|_2^2 \\
\leq \frac{1}{4 \rho_2^2} |\nabla \mu|_2^2 + C \varepsilon^2 |\nabla \mu|_2^2 |\Delta \varphi|_2^2 + C \varepsilon^2 m(\mu)_2^2 |\nabla \varphi|_2^2 \\
\leq \frac{1}{4 \rho_2^2} |\nabla \mu|_2^2 + C \varepsilon^2 |\nabla \mu|_2^2 |\Delta \varphi|_2^2 + C \varepsilon^2 (1 + |\nabla \varphi|_2^2) |\nabla \varphi|_2^2. \quad (3.14)
\]

Summing (3.9), \( \varepsilon \times (3.10), \varepsilon^{3/2} \times (3.11), (3.12) \) and (3.14) we finally get the energy estimate we need

\[
\frac{d}{dt} \left( \frac{\alpha}{2} |\nabla \varphi|_2^2 + \frac{1}{2} |\sqrt{\rho} u|_2^2 + \int_{\Omega} F(\varphi) + \varepsilon \frac{\alpha}{2} |\nabla \varphi|_2^2 + \varepsilon^{3/2} |\frac{1}{\sqrt{\rho}} \nabla \left( \frac{\mu}{\rho} \right)|_2^2 \right) \\
+ 2 \int_{\Omega} \eta(\varphi)|D(u)|^2 + \frac{1}{4 \rho_2^2} |\nabla \mu|_2^2 + \frac{1}{4} \left| \nabla \left( \frac{\mu}{\rho} \right) \right|_2^2 + C |\nabla \varphi|_2^2 \\
+ C |\Delta \varphi|_2^2 + C \left( \int_{\Omega} F(\varphi) \right) + \varepsilon \left| \frac{\partial \varphi}{\partial t} \right|_2^2 + \varepsilon^{3/2} \alpha \int_{\Omega} \frac{1}{\rho} \left| \nabla \frac{\partial \varphi}{\partial t} \right|_2^2 \\
\leq C F_4(m(\varphi_0)) + C \varepsilon^2 |\nabla \mu|_2^2 |\Delta \varphi|_2^2 + C \varepsilon^2 m(\mu)_2^2 |\nabla \varphi|_2^2 \\
+ \frac{\varepsilon}{4} \int_{\Omega} (1 - \varphi^2) \nabla \left( \frac{\mu}{\rho} \right) u + \int_{\Omega} \left( \frac{\rho' \varphi}{\nu^3(\varphi)} \right) \mu \nabla \varphi \cdot \nabla \mu + \int_{\Omega} \rho g u
\]
from which we deduce

and

and so

\[ \Delta \varphi = \frac{1}{\alpha} (-\mu + F'(\varphi)), \]

from which we deduce

\[ \varphi - \varepsilon \int \frac{\rho'}{\rho^3} (\varphi) \Delta \varphi \nabla \varphi \cdot \nabla \frac{\partial \varphi}{\partial t} + \frac{1}{2} \int \frac{\rho' \varphi}{\rho^3} |u|^2 u \cdot \nabla \varphi + \frac{1}{2} \int \frac{\rho' \varphi}{\rho^3} |u|^2 \frac{\partial \varphi}{\partial t} \]

\[ - \varepsilon \int \frac{\varphi}{\rho^3} \frac{\partial \varphi}{\partial t} + \varepsilon \alpha \int \frac{\rho'(\varphi)}{\rho^3(\varphi)} |\Delta \varphi|^2 \frac{\partial \varphi}{\partial t} - \varepsilon \int \frac{1}{\rho} \nabla \left( \frac{F'(\varphi)}{\rho(\varphi)} \right) \cdot \nabla \frac{\partial \varphi}{\partial t} \]

\[ - \varepsilon^{3/2} \int \frac{\varphi}{\rho^2(\varphi)} \left( \frac{F''(\varphi)}{\rho(\varphi)} - \frac{F'(\varphi)\rho'(\varphi)}{\rho^2(\varphi)} \right) - \varepsilon^{3/2} \int \frac{\rho'(\varphi)}{\rho^3(\varphi)} \nabla \left( \frac{\mu}{\rho} \right) \frac{\partial \varphi}{\partial t} \]

\[ - \frac{U}{\Omega} \int (v) \nabla \mu - U \int \rho(\mu \nabla v) - U \int (v) \nabla u + 2U \int \eta(\varphi) D(v) : D(u) \]

\[ - \varepsilon U \int (v) \nabla \varphi \frac{\partial \varphi}{\partial t} - \varepsilon^{3/2} U \int (v) \nabla \varphi \frac{\partial \varphi}{\partial t} (\frac{\mu}{\rho}). \quad (3.15) \]

**Step 3.** We introduce the following functionals

\[ y_\varepsilon(t) = \frac{\alpha}{2} |\nabla \varphi|^2 + \frac{1}{2} \sqrt{\rho} |u|^2 + \int \frac{\alpha}{2} \left| \frac{1}{\rho} \Delta \varphi \right|^2 + \varepsilon^{3/2} \left| \frac{1}{\rho} \nabla \left( \frac{\mu}{\rho} \right) \right|^2, \]

\[ z_\varepsilon(t) = \eta_1 |\nabla u|^2 + \frac{1}{4\rho^2} |\nabla \mu|^2 + \frac{1}{4} \left| \nabla \left( \frac{\mu}{\rho} \right) \right|^2 + C |\nabla \varphi|^2 + C |\nabla \varphi|^2 + C \left( \int F(\varphi) \right) \]

\[ + \varepsilon \left| \frac{\partial \varphi}{\partial t} \right|^2 + \varepsilon^{3/2} \frac{\alpha}{\rho^2} \left| \nabla \frac{\partial \varphi}{\partial t} \right|^2. \]

Then we can prove the following result.

**LEMMA 3.1.** There exists \( \beta, C > 0 \) such that for any \( 0 < \varepsilon \leq 1 \), we have

\[ \varepsilon^{3/2} |\Delta \varphi|^2 \leq C (y_\varepsilon + y_\varepsilon^\beta), \quad (3.16) \]

\[ \varepsilon^{3/4} |\varphi|^2 \leq C (y_\varepsilon + y_\varepsilon^\beta), \quad (3.17) \]

and

\[ y_\varepsilon \leq C z_\varepsilon. \quad (3.18) \]

**Proof.** We have from Eq. (3.6)

\[ \Delta \varphi = \frac{1}{\alpha} (-\mu + F'(\varphi)), \]

and so

\[ \nabla \Delta \varphi = -\frac{1}{\alpha} \rho \nabla \left( \frac{\mu}{\rho} \right) - \frac{1}{\alpha} \rho \nabla \varphi + \frac{F'(\varphi)}{\alpha} \nabla \varphi, \]

from which we deduce
Finally we have

$$|\nabla \Delta \varphi|^2 \leq C \left( \frac{\mu}{\rho} \right)^2 + C \varepsilon^2 \left( \frac{\mu}{\rho} \right)^2 + C|\nabla \varphi|^2 + C \int_{\Omega} |\varphi|^{p-2}|\nabla \varphi|^2$$

$$\leq C \left( \frac{\mu}{\rho} \right)^2 + C \varepsilon^2 \left( \frac{\mu}{\rho} \right)^2 |\Delta \varphi|^2 + C|\nabla \varphi|^2 + C|\varphi|^{2p-2}|\nabla \varphi|^2$$

$$\leq C \left( \frac{\mu}{\rho} \right)^2 + C \varepsilon^2 \left( \frac{\mu}{\rho} \right)^2 |\Delta \varphi|^2 + C|\nabla \varphi|^2 + C|\varphi|^{2p-2}|\Delta \varphi|^2.$$ 

Finally we have

$$\varepsilon^{3/2}|\nabla \Delta \varphi|^2 \leq C(y_\varepsilon + \varepsilon y_\varepsilon^2 + \varepsilon^{1/2} y_\varepsilon^p),$$

so that we get (3.16) with $\beta = \max(2, p) > 1$. In order to show (3.17) we integrate by parts and use (3.16),

$$\varepsilon^{3/4}|\Delta \varphi|^2 \leq \varepsilon^{3/4} \int_{\Omega} |\nabla \varphi||\nabla \Delta \varphi| \leq \varepsilon^{3/4}|\nabla \varphi|^2 |\nabla \Delta \varphi|^2 \leq \frac{1}{2}|\nabla \varphi|^2 + \frac{1}{2}\varepsilon^{3/2}|\nabla \Delta \varphi|^2$$

$$\leq C(y_\varepsilon + y_\varepsilon^{(\beta+1)/2}) \leq C(y_\varepsilon + y_\varepsilon^\beta).$$

The third point is clear from the definitions of $y_\varepsilon$ and $z_\varepsilon$. \hfill \Box

**Remark 3.4.** –

- The first point of the lemma give us a control on the $H^3$-norm of $\varphi$ in terms of $y_\varepsilon$ which is not a priori obvious.
- The second point will be very useful in the sequel. Indeed, if we look at the definition of $y_\varepsilon$, we have

$$\varepsilon^{3/2}|\Delta \varphi|^2 \leq Cy_\varepsilon,$$

whereas (3.17) let us estimate $|\Delta \varphi|^2$ with a smaller power of $\varepsilon$ (namely $\varepsilon^{3/4}$) under the condition that we allow the presence of powers of $y_\varepsilon$ greater than 1.
- The third point of the lemma is the key-point of the end of the proof, when an ordinary differential equation argument is used to conclude. Estimates (3.12)–(3.14) are just derived in order for this control of $y_\varepsilon$ by $z_\varepsilon$ to be true.

Let us go back to the proof of Theorem 3.2. We obtain from (3.15) the differential inequality

$$\frac{d}{dt}y_\varepsilon + z_\varepsilon \leq C F_4(m(\varphi_0)) + C\varepsilon y_\varepsilon z_\varepsilon + C\varepsilon^2(1 + y_\varepsilon^p)z_\varepsilon + I_1 + \cdots + I_{20},$$

(3.19)

where $I_1, \ldots, I_{20}$ denote the twenty integrals of the right-hand side of (3.15). From now on, we wish to estimate each of these terms in function of $\varepsilon$, $y_\varepsilon$ and $z_\varepsilon$.

Using (3.8) and the boundary conditions on $u$, the first term reads after integration by parts

$$|I_1| \leq \frac{\varepsilon}{2} \int_{\Omega} \frac{\varphi}{\rho(\varphi)} \mu \nabla \varphi.u = \frac{\varepsilon}{2} \int_{\Omega} \frac{\varphi}{\rho(\varphi)} (\mu - m(\mu)) \nabla \varphi.u$$

$$\leq C\varepsilon[(m(\varphi_0))]|\nabla \varphi|^2|\mu - m(\mu)|_6|u|_6$$

$$\leq C\varepsilon(|\nabla \mu|^2 + |\nabla u|^2)(|\nabla \varphi|^2 + |\nabla \varphi|^2) \leq C\varepsilon(y_\varepsilon + y_\varepsilon^{1/2}) z_\varepsilon.$$

(3.20)
We notice that $|\rho'(\varphi)| \leq \varepsilon$ to obtain, with the Sobolev embedding $H^{1/2} \subset L^3$ (in dimension $d \leq 3$),

$$
|I_2| \leq \frac{\varepsilon}{\rho_1} (|\mu - m(\mu)|_6 + |m(\mu)|) |\nabla \varphi| |\nabla \mu|_2 \leq C \varepsilon |\nabla \mu|_2 (1 + |\nabla \mu|_2 + |\nabla \varphi|_2^p) |\nabla \varphi|_3
\leq C \varepsilon^{3/4} |\nabla \mu|_2 (1 + |\nabla \mu|_2 + |\nabla \varphi|_2^p) (|\nabla \varphi|_2^{1/2}) (\varepsilon^{1/4} |\Delta \varphi|_2^{1/2})
\leq C \varepsilon^{3/4} \gamma_\varepsilon^{1/2} \varepsilon + C \varepsilon \varepsilon. \quad (3.21)
$$

The third term is obviously estimated as follows using (3.18) and Young’s inequality

$$
|I_3| \leq \rho_2 |g|_2 |u|_2 \leq C \gamma_\varepsilon^{1/2} \leq C + \frac{1}{8} \varepsilon. \quad (3.22)
$$

Using the previous lemma and particularly (3.16) we obtain

$$
|I_4| \leq C \varepsilon^2 |\nabla \varphi|_2 |\nabla \varphi|_4 |\Delta \varphi|_4 \leq C \varepsilon^2 |\nabla \varphi|_2 |\Delta \varphi|_2 |\nabla \Delta \varphi|_2
\leq C \varepsilon^{1/2} (\varepsilon^{3/4} |\nabla \varphi|_2 |\Delta \varphi|_2) (\varepsilon^{3/4} |\nabla \Delta \varphi|_2) \leq C \varepsilon^{1/2} \gamma_\varepsilon^{1/2} (y_\varepsilon^2 + \gamma_\varepsilon^{1/2} \gamma_\varepsilon. \quad (3.23)
$$

Using another time that $|\rho'(\varphi)| \leq \varepsilon$ we get

$$
|I_5| \leq \frac{\varepsilon}{2} \int_\Omega |u|^3 |\nabla \varphi| \leq C \varepsilon |u|_3^3 |\nabla \varphi|_6
\leq C \varepsilon |u|_2^3 |\nabla \varphi| \leq C \varepsilon |u|_2 |\nabla \varphi|_2 |\Delta \varphi|_2
\leq C \sqrt{\varepsilon} |\nabla \varphi|_2 |(|u|_2^2 + \varepsilon |\Delta \varphi|_2^2) \leq C \sqrt{\varepsilon} \gamma_\varepsilon \varepsilon. \quad (3.24)
$$

The sixth and seventh terms are estimated as follows

$$
|I_6| \leq C \varepsilon \int_\Omega |u|^3 |\nabla \varphi|_2 \leq C \varepsilon |u|^3 |\nabla \varphi|_3
\leq C \varepsilon |u|_2 |\nabla \varphi|_2 |\nabla \varphi|_2
\leq C \varepsilon^{3/8} |u|_2 \left( |\nabla \varphi|_2^{1/2} \left| \nabla \varphi|_2^{1/2} \right| \right)
\leq C \varepsilon^{3/8} |u|_2 \left( |\nabla \varphi|_2^{1/2} + \varepsilon |\nabla \varphi|_2^{1/2} \right)
\leq C \varepsilon^{3/8} \gamma_\varepsilon^{1/2} \varepsilon. \quad (3.25)
$$

$$
|I_7| \leq \varepsilon |u|_4 |\nabla \varphi|_2 |\nabla \varphi|_2 |\nabla \varphi|_2
\leq C \varepsilon |u|_2 |\nabla \varphi|_2 |\nabla \varphi|_2
\leq C \varepsilon^{1/4} |\nabla \varphi|_2 \left( |\nabla \varphi|_2^{1/2} + \varepsilon |\nabla \varphi|_2^{1/2} \right)
\leq C \varepsilon^{1/4} \gamma_\varepsilon^{1/2} \varepsilon. \quad (3.26)
$$

Using (3.16), we get

$$
|I_8| \leq \frac{\alpha \varepsilon^2}{2 \rho_1} |\Delta \varphi|_3^2 |\nabla \varphi|_3 \leq C \varepsilon^2 |\Delta \varphi|_2 |\nabla \Delta \varphi|_2
\leq C \varepsilon^{5/8} \gamma_\varepsilon^{1/2} \varepsilon. \quad (3.27)
$$
In order to estimate the next term, we must derive estimates for $|\nabla F(\varphi)|_2$ and $|\nabla F'(\varphi)|_2$. More precisely, thanks to the assumption (2.9) on $F$ we have

- If $d = 2$, or $d = 3$ and $p \leq 2$, thanks to the embedding $H^1 \subset L^{3p}_2$

$$|\nabla F(\varphi)|_2^2 = \int_\Omega |F'(\varphi)|^2 |\nabla \varphi|^2 \leq C |\nabla \varphi|_2^2 + C \int_\Omega |\varphi - m(\varphi_0)|^{2p} |\nabla \varphi|^2$$

$$\leq C |\nabla \varphi|_2^2 + C |\nabla \varphi|_2^{2p} |\Delta \varphi|_2^2.$$ (3.28)

- If $d = 3$ and $2 < p \leq 3$, thanks to the embedding $H^{3/2-1/p} \subset L^{3p}$

$$|\nabla F(\varphi)|_2^2 \leq |\nabla \varphi|_2^3 + C |\nabla \varphi|_2^{2p+2} |\Delta \varphi|_2^p.$$ (3.29)

In the same way, in both dimensions $d = 2$ and $d = 3$, we have thanks to the embedding $H^1 \subset L^{3p-3}$

$$|\nabla F'(\varphi)|_2^2 = \int_\Omega |F''(\varphi)|^2 |\nabla \varphi|^2 \leq C |\nabla \varphi|_2^2 + C \int_\Omega |\varphi - m(\varphi_0)|^{2p-2} |\nabla \varphi|^2$$

$$\leq C |\nabla \varphi|_2^2 + C |\nabla \varphi|_2^{2p-2} |\Delta \varphi|_2^2.$$ (3.30)

We deduce from these estimates that

$$|I_0| \leq \varepsilon \left( \frac{F'(\varphi)}{\rho(\varphi)} \right)_2 \left( \nabla \frac{\partial \varphi}{\partial t} \right)_2 \leq C \varepsilon |\nabla F'(\varphi)|_2 \left| \nabla \frac{\partial \varphi}{\partial t} \right|_2 + C \varepsilon^2 |\nabla F(\varphi)|_2 \left| \nabla \frac{\partial \varphi}{\partial t} \right|_2$$

$$\leq C \varepsilon \left( |\nabla \varphi|_2 + |\nabla \varphi|_2^{p-1} |\Delta \varphi|_2 \right) \left| \nabla \frac{\partial \varphi}{\partial t} \right|_2 + C \varepsilon^2 \left( |\nabla \varphi|_2 + |\nabla \varphi|_2^{p-1} |\Delta \varphi|_2 \right) \left| \nabla \frac{\partial \varphi}{\partial t} \right|_2$$

$$\leq C \varepsilon^{1/4} \left( 1 + y_e^{(p-1)/2} \right) z_\varepsilon + C \varepsilon^{5/4} \left( 1 + y_e^{p/2} \right) z_\varepsilon \leq C \varepsilon^{1/4} \left( 1 + y_e^{p/2} \right) z_\varepsilon.$$ (3.31)

We can now write

$$|I_{10}| \leq \varepsilon^{3/2} \left| \int_\Omega u \nabla \varphi \left( \frac{F''(\varphi)}{\rho(\varphi)} - \frac{F'(\varphi)\rho'(\varphi)}{\rho^2(\varphi)} \right) \frac{\partial \varphi}{\partial t} \right| + \alpha \varepsilon^{3/2} \left| \int_\Omega u \nabla \varphi \frac{\partial}{\partial t} \left( \frac{\Delta \varphi}{\rho(\varphi)} \right) \right|.$$ (3.32)

We estimate separately the two terms $A$ and $B$ of this last inequality, using (3.17) and (3.28)–(3.30). The following computations are made in the case $d = 3$ and $2 < p \leq 3$, but one clearly have the same kind of estimates in the other case

$$|A| \leq \varepsilon^{3/2} |u_3| |\nabla F'(\varphi)|_2 \left| \nabla \frac{\partial \varphi}{\partial t} \right|_6 + \varepsilon^{5/2} |u_3| |\nabla F(\varphi)|_2 \left| \nabla \frac{\partial \varphi}{\partial t} \right|_6$$

$$\leq C |u_2^{1/2} |\nabla u_2^{1/2} |^{3/2} |\nabla F'(\varphi)|_2 + \varepsilon^{5/2} |\nabla F(\varphi)|_2 \left| \nabla \frac{\partial \varphi}{\partial t} \right|_2$$

$$\leq C |u_2^{1/2} \left( \varepsilon^{3/4} \left( |\nabla \varphi_2^{1/2} + |\nabla \varphi_2|^{p-1} |\Delta \varphi|_2^{1/2} \right) \right.$$ (3.33)

$$+ \varepsilon^{7/4} \left( |\nabla \varphi_2|^{1/2} + |\nabla \varphi_2|^{p/2+1} |\Delta \varphi_2^{(p-1)/2} \right) \left( \varepsilon^{3/4} \left| \nabla \frac{\partial \varphi}{\partial t} \right|_2 |\nabla u_2^{1/2} | |\Delta \varphi|_2 \right)$$

$$\leq C \varepsilon^{3/8} y_e^{1/4} \left( y_e^{1/4} + y_e^{(p+1)/2} \right) z_\varepsilon.$$ (3.34)
Moreover, with Agmon’s inequalities (2.6) and the Sobolev embedding $H^{3/4} \subseteq L^4$ in both dimensions 2 and 3, we have

$$\|\nabla (u, \nabla \phi)\|_2 \leq \|\nabla u\|_2 \|\nabla \phi\|_\infty + \|u, D^2 \phi\|_2 \leq \|\nabla u\|_2 \|\Delta \phi\|^{1/2}_2 |\nabla \Delta \phi|^{1/2}_2 + |u|_4 |D^2 \phi|_4$$

$$\leq \|\nabla u\|_2 \|\Delta \phi\|^{1/2}_2 |\nabla \Delta \phi|^{1/2}_2 + |u|_4 |\nabla u|_2 \|\Delta \phi|^{1/4}_4 |\nabla \Delta \phi|^{1/4}_2 ,$$

so that finally, we get

$$|B| \leq C \varepsilon^{3/4} y \varepsilon + C \varepsilon^{3/16} (\varepsilon^{3/16} |\nabla \phi|^{1/2}_2 \varepsilon^{3/8} |\nabla \Delta \phi|^{1/2}_2) \left( |\nabla u|_2 \varepsilon^{3/4} |\nabla \phi|_2 \right)$$

$$+ C \varepsilon^{3/16} (|u|_2^{1/4} \varepsilon^{3/16} |\nabla \Delta \phi|^{3/4}_2) \left( |\nabla u|_2^{3/4} |\Delta \phi|_2^{1/4} \varepsilon^{3/4} |\nabla \phi|_2 \right)$$

$$\leq C \varepsilon^{3/4} y \varepsilon + \varepsilon^{3/16} (y \varepsilon + y^{\beta/2} \varepsilon).$$

As a consequence, we get the following estimate for the tenth term

$$|I_{10}| \leq C \varepsilon^{3/16} (y^{1/2} + y^{(\beta+1+\beta)/2}) \varepsilon. \quad (3.32)$$

The estimates for the two next terms are straightforward

$$|I_{11}| \leq C \varepsilon^{5/2} \left| \frac{\partial \phi}{\partial t} \right|_{1,6} \left| \frac{\nabla \phi}{\partial t} \right|_{2} \left| \nabla \phi \right|_3 \leq C \varepsilon^{3/4} (|\nabla \phi|^{1/2}_2 \varepsilon^{1/4} |\Delta \phi|^{1/2}_2) \left( \varepsilon^{3/2} \left| \frac{\nabla \phi}{\partial t} \right|_2 ^{2} \right)$$

$$\leq C \varepsilon^{3/4} y^{1/2}, \quad (3.33)$$

and

$$|I_{12}| \leq C \varepsilon^{5/2} \left| \frac{\partial \phi}{\partial t} \right|_{3} ^{2} |\Delta \phi|_3 \leq C \varepsilon^{1/8} (\varepsilon^{3/8} |\Delta \phi|_2 \varepsilon^{3/4} |\nabla \Delta \phi|_2) \left( \varepsilon^{1/2} \left| \frac{\partial \phi}{\partial t} \right| _2 ^{3/4} \left| \nabla \phi \right|_2 \right)$$

$$\leq C \varepsilon^{1/8} (y \varepsilon + y^{\beta} \varepsilon). \quad (3.34)$$
Using assumption (2.9) on $F$ and the Sobolev embeddings, we derive the following estimate

$$|I_{13}| \leq C \varepsilon^{3/2} \int_{\Omega} \left| \frac{\partial \varphi}{\partial t} \right|^2 |F''(\varphi)| + C \varepsilon^{5/2} \int_{\Omega} \left| \frac{\partial \varphi}{\partial t} \right|^2 |F'(\varphi)|$$

$$\leq C \varepsilon^{3/2} \left| \frac{\partial \varphi}{\partial t} \right|_{L^2}^2 + C \varepsilon^{3/2} \int_{\Omega} \left| \frac{\partial \varphi}{\partial t} \right|^2 |\varphi|^{p-1} + C \varepsilon^{5/2} \left| \frac{\partial \varphi}{\partial t} \right|_{L^4}^2 |\varphi|^p$$

$$\leq C \varepsilon^{3/2} \left| \frac{\partial \varphi}{\partial t} \right|_{L^2}^2 + C \varepsilon^{3/2} \left| \frac{\partial \varphi}{\partial t} \right|_{L^3}^2 \left| \nabla \varphi \right|_{L^2}^2 + C \varepsilon^{5/2} \left| \frac{\partial \varphi}{\partial t} \right|_{L^4}^2 \left| \nabla \varphi \right|_{L^2}^2$$

$$\leq C \varepsilon^{1/2} z_\varepsilon + C \varepsilon^{1/4} z_\varepsilon y_\varepsilon^{(p-1)/2} + C \varepsilon^{9/8} z_\varepsilon y_\varepsilon^{p/2}.$$  (3.35)

From the Cahn–Hilliard equation (3.5) we deduce

$$\Delta \left( \frac{\mu}{\rho} \right) = \rho \left( \frac{\partial \varphi}{\partial t} + u \cdot \nabla \varphi + U \nu_x \cdot \nabla \varphi + \frac{\rho'(\varphi)}{\rho^2(\varphi)} \nabla \varphi \cdot \nabla \left( \frac{\mu}{\rho} \right) \right),$$

so that,

$$\left| \Delta \left( \frac{\mu}{\rho} \right) \right|_{L^2} \leq C \left( \left| \frac{\partial \varphi}{\partial t} \right|_{L^2}^2 + |u|_{L^2}^2 |\nabla \varphi|^2_{L^2} + U^2 |\nabla \varphi|^2_{L^2} + \varepsilon^2 \left| \nabla \left( \frac{\mu}{\rho} \right) \right|^2_{L^3} |\nabla \varphi|^2_{L^2},$$

and then with the embedding $H^{1/2} \subset L^3$ we get

$$\left| \Delta \left( \frac{\mu}{\rho} \right) \right|_{L^2} \leq C \left( \left| \frac{\partial \varphi}{\partial t} \right|_{L^2}^2 + |u|_{L^2}^2 |\nabla \Delta \varphi|^2_{L^2} + U |\nabla \varphi|^2_{L^2} + \varepsilon^2 \left| \nabla \left( \frac{\mu}{\rho} \right) \right|^2_{L^2} |\Delta \varphi|^2_{L^2}. \right) \quad (3.36)$$

Finally, we obtain that the next term is estimated as follows

$$|I_{14}| \leq C \varepsilon^{5/2} \left| \nabla \left( \frac{\mu}{\rho} \right) \right|_{H^{1/4}}^2 \leq C \varepsilon^{5/2} \left( \left| \frac{\partial \varphi}{\partial t} \right|_{L^2}^2 \right) \left| \Delta \left( \frac{\mu}{\rho} \right) \right|_{L^2}^2 \left| \frac{\partial \varphi}{\partial t} \right|_{L^2}^{1/2} \left| \frac{\partial \varphi}{\partial t} \right|_{L^2}^{1/2}$$

$$\leq C \varepsilon^{5/8} \left( \varepsilon^{3/4} \left| \nabla \left( \frac{\mu}{\rho} \right) \right|_{L^2} \right) \left( \varepsilon^{3/4} \left| \nabla \varphi \right|_{L^2} \right) \left( \varepsilon^{3/8} \left| \frac{\partial \varphi}{\partial t} \right|_{L^2} \right) \left( \varepsilon^{3/8} \left| \frac{\partial \varphi}{\partial t} \right|_{L^2} \right)$$

$$\leq C \varepsilon^{15/8} |u|_{L^2} \left( \varepsilon^{3/4} |\nabla \Delta \varphi|^2_{L^2} \right) \left( \varepsilon^{1/4} \left| \frac{\partial \varphi}{\partial t} \right|_{L^2} \right) \left( \varepsilon^{3/8} \left| \nabla \varphi \right|_{L^2} \right) \left( \varepsilon^{3/8} \left| \frac{\partial \varphi}{\partial t} \right|_{L^2} \right) \left( \varepsilon^{15/8} |\Delta \varphi|^2_{L^2} \right).$$
The next five integrals can be easily estimated as follows

\[ I_{15} = \left| \int U v_\lambda \cdot \nabla \varphi (\mu - m(\mu)) \right| \]
\[ \leq U |v_\lambda|_4 |\nabla \varphi|_2 |\mu - m(\mu)|_4 \leq U \lambda |\nabla \varphi|_2 |\nabla \mu|_2 \leq U \lambda z_\epsilon, \]
\[ |I_{16}| \leq \left| \int \rho'(\varphi)(u \cdot \nabla \varphi)(u \cdot v_\lambda) \right| + \left| \int \rho(u \cdot \nabla v_\lambda) \right| \]
\[ \leq \varepsilon U |\nabla \varphi|_2 |\nabla u|_2^2 |v_\lambda|_\infty + U |v_\lambda|_4 |\nabla u|_2^2 \leq \varepsilon y^1/2 z_\epsilon + \lambda U z_\epsilon, \]
\[ |I_{17}| \leq U |v_\lambda|_4 |\nabla u|_2^2 \leq \lambda U z_\epsilon, \]
\[ |I_{18}| \leq CU |D(u)|_2 |D(v_\lambda)|_2 \leq \frac{1}{8} z_\epsilon + CU^2 |D(v_\lambda)|^2, \]
\[ |I_{19}| \leq \epsilon^{1/4} U |v_\lambda|_4 |\nabla \varphi|_2 \left( \epsilon^{3/4} \left| \nabla \frac{\partial \varphi}{\partial t} \right|_2 \right) \leq \epsilon^{1/4} U \lambda z_\epsilon. \]

Finally, using (3.28)–(3.30) and Agmon’s inequalities (2.6), we can conclude our estimates with the last term in the following way if we suppose that \( d = 2 \) or \( d = 3 \) and \( p \leq 2 \)

\[ |I_{20}| \leq \varepsilon^{3/2} U \left| \int v_\lambda \cdot \nabla \varphi \left( \frac{F'}{\rho} \right)' \varphi \frac{\partial \varphi}{\partial t} + \varepsilon^{3/2} U \left| \int \frac{1}{\rho} \nabla (v_\lambda \cdot \nabla \varphi) \cdot \nabla \frac{\partial \varphi}{\partial t} \right| \]
\[ + \varepsilon^{3/2} U \left| \int v_\lambda \cdot \nabla \varphi \frac{\rho'(\varphi)}{\rho^2(\varphi)} \frac{\partial \varphi}{\partial t} \Delta \varphi \right| \]
\[ \leq C \varepsilon^{3/2} |v_\lambda|_\infty |\nabla F'(\varphi)|_2 \left| \frac{\partial \varphi}{\partial t} \right|_2 + C \varepsilon^{5/2} |v_\lambda|_\infty |\nabla F(\varphi)|_2 \left| \frac{\partial \varphi}{\partial t} \right|_2 \]
\[ + C \varepsilon^{3/2} |v_\lambda|_2 |\nabla \varphi|_\infty \left| \nabla \frac{\partial \varphi}{\partial t} \right|_2 \]
\[ + C \varepsilon^{3/2} |v_\lambda|_\infty |\Delta \varphi|_2 \left| \nabla \frac{\partial \varphi}{\partial t} \right|_2 + C \varepsilon^{5/2} |v_\lambda|_\infty |\Delta \varphi|_2 \left| \nabla \frac{\partial \varphi}{\partial t} \right|_2 \]
\[ \leq C \varepsilon (1 + |\nabla \varphi|_2^{p-1}) \left( |\Delta \varphi|_2 \varepsilon^{1/2} \left| \frac{\partial \varphi}{\partial t} \right|_2 \right) + C \varepsilon^2 (1 + |\nabla \varphi|_2^{p}) \left( |\Delta \varphi|_2 \varepsilon^{1/2} \left| \frac{\partial \varphi}{\partial t} \right|_2 \right) \]
\[ + C \varepsilon^{3/2} \left| \nabla \frac{\partial \varphi}{\partial t} \right|_2 |\Delta \varphi|_2^{1/2} |\nabla \Delta \varphi|_2^{1/2} + C \varepsilon^{3/4} \left( |\Delta \varphi|_2 \varepsilon^{3/4} \left| \nabla \frac{\partial \varphi}{\partial t} \right|_2 \right) \]
\[ + C\varepsilon^{5/4} \left( \varepsilon^{1/2} |\Delta \varphi|_2 \right) \left( |\Delta \varphi|_2 \varepsilon^{3/4} \left| \nabla \frac{\partial \varphi}{\partial t} \right|_2 \right) \]
\[ \leq C \varepsilon \left( 1 + \varepsilon^{(p-1)/2} \right) z_{\varepsilon} + C \varepsilon^2 (1 + \varepsilon^{p/2}) z_{\varepsilon} + C \varepsilon^{3/8} (1 + \varepsilon^{(\beta-1)/2}) z_{\varepsilon} \]
\[ + C \varepsilon^{3/4} z_{\varepsilon}^3 \]
\[ \leq C\varepsilon \left( 1 + \frac{1}{16} \varepsilon^{1/8} y_{\varepsilon} \right) z_{\varepsilon}, \quad (3.43) \]

In the case \( d = 3 \) and \( 2 < p \leq 3 \), we use (3.29) instead of (3.28) and we easily get the same kind of estimate.

**Step 4.** With (3.20)–(3.43), our energy estimate (3.19) reads
\[ \frac{\partial}{\partial t} y_{\varepsilon} + \frac{1}{4} z_{\varepsilon} \leq C + C\varepsilon^{1/2} z_{\varepsilon} + C\lambda U z_{\varepsilon} + C\varepsilon^{1/8} (1 + \varepsilon^{q}) z_{\varepsilon}, \quad (3.44) \]
where \( q > 0 \) depends only on \( p \) and \( \beta \).

From now on, we impose \( \varepsilon < \varepsilon_1 = 1/(16C)^2 \) and we choose \( \lambda \) such that \( C\lambda U < 1/16 \), so that we have
\[ \frac{\partial}{\partial t} y_{\varepsilon} + \frac{1}{8} z_{\varepsilon} \leq C + C\varepsilon^{1/8} (1 + \varepsilon^{q}) z_{\varepsilon}. \quad (3.45) \]
Let \( M_{\varepsilon} > 0 \) be the solution of
\[ C\varepsilon^{1/8} (1 + M_{\varepsilon}^q) = \frac{1}{16}. \]

One can easily see that
\[ M_{\varepsilon} \to + \infty, \quad \text{when} \ \varepsilon \to 0. \]

Moreover, thanks to the assumption on the initial data we have for a constant \( K > 0 \),
\[ y_{\varepsilon}(0) \leq K(C_0 + U) \]
so that there exists \( \varepsilon_0 < \varepsilon_1 \) such that if \( \varepsilon < \varepsilon_0 \) we have
\[ y_{\varepsilon}(0) \leq \frac{1}{2} M_{\varepsilon}. \]

Hence, if we choose now \( \varepsilon < \varepsilon_0 \), there exists a maximal time \( T^* \in [0, +\infty] \) such that \( y_{\varepsilon}(t) < M_{\varepsilon} \) for any \( t \in [0, T^*] \). Thanks to this property and the definition of \( M_{\varepsilon} \) we infer from (3.45) that for any \( t \in [0, T^*] \) we have
\[ \frac{d}{dt} y_{\varepsilon} + \frac{1}{16} z_{\varepsilon} \leq C, \]
and so using (3.18) we deduce that on \( [0, T^*] \) we have
\[ \frac{d}{dt} y_{\varepsilon} + C' y_{\varepsilon} \leq C. \]

We easily get from this inequality the estimate
\[ y_{\varepsilon}(t) \leq y_{\varepsilon}(0) e^{-C't} + \frac{C}{C'} \leq K(C_0 + U) + \frac{C}{C'}, \]
and finally if $\varepsilon$ is small enough so that $\frac{1}{2} M_\varepsilon > K(C_0 + U) + \frac{C}{C'}$ we have for any $t \in [0, T^*[$ the inequality
\[
y_\varepsilon(t) \leq \frac{1}{2} M_\varepsilon.
\]
If $T^*$ is finite, this is in contradiction with the maximality of $T^*$. This implies that necessarily we have
\[
T^* = +\infty,
\]
that is to say that we have global and uniform in time estimates
\[
\sup_{t \in \mathbb{R}^+} y_\varepsilon(t) \leq K(C_0 + U) + \frac{C}{C'} + C C',
\]
\[
\sup_{t \in \mathbb{R}^+} \int_t^{t+\tau} z_\varepsilon(s) \, ds \leq 16 \left( K(C_0 + U) + \frac{C}{C'} + C C' + C \tau \right),
\]
which implies estimates (3.1) and (3.2).

**Step 5.** As it is classical (see [5]), we only give now the sketch of the proof of (3.3) from (3.1)–(3.2) in the case $U = 0$ (for simplicity).

Denoting by $\Omega_I$ the set $]0, T[ \times \Omega$, we take a test function $w \in L^2(0, T; V_{d/2})$ for the nonhomogeneous Navier–Stokes equation to get
\[
\int_{\Omega_T} \mathcal{P} \left( \frac{\partial \rho}{\partial t} v \right) . w = \int_{\Omega_T} \frac{\partial \rho}{\partial t} v . w + \int_{\Omega_T} \rho v . \nabla v . w - \int_{\Omega_T} 2\eta(\phi) D(v) : D(w)
\]
\[
+ \int_{\Omega_T} \mu \nabla \phi . w - \varepsilon \int_{\Omega_T} \frac{\phi^2}{4} \nabla \left( \frac{\mu}{\rho} \right) . w + \int_{\Omega_T} \rho g . w.
\]
(3.46)

Using the fact that $\rho$ and $1/\rho$ are uniformly bounded independently of $\varepsilon$, and the estimate
\[
\left| \int_{\Omega_T} \frac{\partial \rho}{\partial t} v . w \right| \leq \varepsilon \int_{\Omega_T} \left| \frac{\partial \phi}{\partial t} \right| |v| |w| \leq \varepsilon \left\| \frac{\partial \phi}{\partial t} \right\|_{L^2(0,T; L^4(\Omega))} \left\| v \right\|_{L^\infty(0,T; H^1(\Omega))} \left\| w \right\|_{L^2(0,T; L^3(\Omega))}
\]
\[
\leq M(T) \left\| w \right\|_{L^2(0,T; V_{d/2})},
\]
we see that finally
\[
\left| \int_{\Omega_T} \mathcal{P} \left( \frac{\partial \rho}{\partial t} v \right) . w \right| \leq M(T) \left\| w \right\|_{L^2(0,T; V_{d/2})}.
\]
Indeed, the other terms in (3.46) are estimated classically (see [5]), the choice of the space $V_{d/2}$ being issued from the nonlinear term. Then, by a duality argument, estimate (3.3) is established.

**Step 6.** Passing to the limit in the equations satisfied by the approximated solutions $(\phi_n, \rho_n, v_n)$ is classical (see [5]) at the condition that we have some compactness on the velocity field $(v_n)$. This is obtained here just like in [19].
More precisely, the compactness on \( \phi_n \) and \( \rho_n \) is a straightforward consequence of (3.1) and (3.2), whereas we get from (3.2) and (3.3) that

\[
P(\rho_n v_n) \text{ is bounded in } L^2(0, T; V),
\]

\[
\frac{\partial}{\partial t} (P(\rho_n v_n)) \text{ is bounded in } L^2(0, T; V_{d/2}).
\]

so that a classical compactness lemma [24] implies that

\[
P(\rho_n v_n) \text{ is compact in } L^2(0, T; H).
\]

Furthermore, we have from (3.2) the weak convergence of \( (\sqrt{\rho_n} v_n) \) in \( L^2(\Omega_T) \) and

\[
\int_{\Omega_T} |\sqrt{\rho_n} v_n|^2 = \int_{\Omega_T} \rho_n |v_n|^2 = \int_{\Omega_T} P(\rho_n v_n) v_n \rightarrow \int_{\Omega_T} P(\rho v) v = \int_{\Omega_T} \rho |v|^2 = \int_{\Omega_T} |\sqrt{\rho} v|^2,
\]

so that finally, we have proved the strong convergence of \( \sqrt{\rho_n} v_n \) towards \( \sqrt{\rho} v \) in \( L^2(\Omega_T) \). This strong convergence allows us to pass to the limit in the nonlinear terms of the Navier–Stokes equation.

Hence, the proof of the existence of the solutions is complete.

**Step 7.** As far as the limit \( \varepsilon \to 0 \) is concerned, the key-point is that, we have enough compactness on the velocity \( v_\varepsilon \) thanks to estimate (3.1), (3.2) and (3.3) which are uniform in \( \varepsilon \).

Moreover, thanks to (3.1) and (3.2), and the fact that \( |\rho'_\varepsilon|_{\infty} \leq \varepsilon \) we see that

\[
\rho_\varepsilon \to 1 \quad \text{in } L^\infty(\mathbb{R}^+; H^1) \text{ strong},
\]

\[
\frac{\partial \rho_\varepsilon}{\partial t} \to 0, \quad \text{in } L^2(\Omega_T) \text{ strong for any } T > 0,
\]

which allow us to perform the limit in the term

\[
\rho_\varepsilon \frac{\partial v_\varepsilon}{\partial t}
\]

in the Navier–Stokes equation. \( \square \)

### 3.2. Strong solutions

In this section, we have to suppose that \( |\rho''_\varepsilon|_{\infty} \leq \varepsilon \). This assumption is clearly reasonable because we recall that \( \rho_\varepsilon \) is essentially linear (see (1.5)) in the physical-meaningful interval \([-1, 1]\).

**Theorem 3.3.** – Let \( U > 0 \), \( v_0 \in v_U^\infty + V \), \( \varphi_0 \in \Phi_3 \) satisfying the boundary conditions. There exists \( \varepsilon_0 > 0 \) depending on \( U \), \( \|v_0\|_1 \), \( \|\varphi_0\|_3 \) and \( F \), such that if \( \varepsilon < \varepsilon_0 \) there exists a unique strong solution \( (\varphi_\varepsilon, v_\varepsilon) \) of the problem for the initial data \( (\varphi_0, v_0) \).

- If \( d = 2 \), this solution is global and satisfies
estimates that we obtain for these strong solutions.

Indeed, the proof of the uniqueness is straightforward (see [5]) using the energy estimates. We recall that we have set 

\[ v \]

and one have

\[ \| \phi \|_{L^\infty(\mathbb{R}^+; \Phi_1)} + \| v \|_{L^\infty(\mathbb{R}^+; V)} \leq C, \]

\[ \| \phi \|_{L^2(0, t_0 + \tau; \Phi_1)} + \| v \|_{L^2(0, t_0 + \tau; V)} \leq C(\tau), \quad \text{for any } t_0, \tau > 0, \]

where C and C(τ) are independent of ε.

If d = 3, the solution is local and satisfies locally the same regularity results than for the 2D case.

Proof. – In the following we concentrate our efforts on the existence part of the theorem. Indeed, the proof of the uniqueness is straightforward (see [5]) using the energy estimates that we obtain for these strong solutions.

Step 1. From Theorem 3.2, we obtain the following estimates for the weak solutions with initial data (φ₀, v₀) independent of ε:

\[ \| \phi \|_{L^\infty(\mathbb{R}^+; \Phi_1)} + \| v \|_{L^\infty(\mathbb{R}^+; \Phi_2)} + \| \partial_t \phi \|_{L^\infty(\mathbb{R}^+; \Phi_3)} \]

\[ + \| \partial_t v \|_{L^\infty(\mathbb{R}^+; \Phi_4)} \leq C, \]

\[ \| \phi \|_{L^2(0, t_0 + \tau; \Phi_1)} + \| v \|_{L^2(0, t_0 + \tau; \Phi_2)} + \| \partial_t \phi \|_{L^2(0, t_0 + \tau; \Phi_3)} + \| \partial_t v \|_{L^2(0, t_0 + \tau; \Phi_4)} \]

\[ + \| \partial_t \phi \|_{L^2(0, t_0 + \tau; \Phi_4)} \leq C(\tau), \quad \text{for any } t_0, \tau > 0. \]

Step 2. Using the fact that \| φ₀ \|₁ and \| v₀ \|₁ are independent of ε, we can derive additional energy estimates. We recall that we have set \( v = u + Uv \), and that in fact we study (3.5)–(3.8) and not (1.1)–(1.4).

We first multiply (3.5) with \( \Delta^2 \phi \) to obtain after integration by parts

\[ \frac{1}{2} \frac{\partial}{\partial t} |\Delta \phi|^2 \Omega = \int \nabla \left( \frac{1}{\rho} \nabla \left( \frac{\mu}{\rho} \right) \right) \Delta^2 \phi - \int \nabla \phi \Delta^2 \varphi - \int v \nabla \phi \Delta^2 \varphi, \]

(3.49)

and one have

\[ \nabla \left( \frac{1}{\rho} \nabla \left( \frac{\mu}{\rho} \right) \right) = - \frac{\alpha'(\varphi)}{\alpha^2(\varphi)} \nabla \varphi \nabla \left( \frac{\mu}{\rho} \right) + \frac{1}{\rho} \Delta \left( \frac{\mu}{\rho} \right) \]

\[ = - \frac{\alpha'(\varphi)}{\alpha^2(\varphi)} \nabla \varphi \nabla \left( \frac{\mu}{\rho} \right) + \frac{1}{\rho^2} \Delta \mu + 2 \frac{\alpha'(\varphi)}{\alpha^2(\varphi)} |\nabla \varphi|^2 \mu - \frac{\alpha''(\varphi)}{\alpha^3(\varphi)} |\nabla \varphi|^2 \mu \]

\[ - 2 \frac{\alpha'(\varphi)}{\alpha^2(\varphi)} \nabla \varphi \nabla \mu - \frac{\alpha''(\varphi)}{\alpha^3(\varphi)} \mu \Delta \varphi, \]

with

\[ \Delta \mu = - \alpha \Delta^2 \varphi + \Delta F'(\varphi). \]

Finally, using the fact that \( |\rho'|_\infty \leq \varepsilon \) and \( |\rho''|_\infty \leq \varepsilon \), we obtain from the previous estimate

\[ \frac{1}{2} \frac{\partial}{\partial t} |\Delta \phi|^2 \Omega + \frac{\alpha}{\rho^2} |\Delta^2 \varphi|^2 \Omega \leq \frac{\varepsilon}{\rho^2} \int |\nabla \varphi| |\nabla \left( \frac{\mu}{\rho} \right)| |\Delta^2 \varphi| + \frac{1}{\rho^2} \int |\Delta F'(\varphi)| |\Delta^2 \varphi| \]
If we use the Agmon-like inequality

\[ + \left( \frac{2\varepsilon^2}{\rho_1^4} + \frac{\varepsilon}{\rho_1^2} \right) \int_\Omega |\nabla \varphi|^2 |\mu| |\Delta^2 \varphi| \]

+ \frac{\varepsilon}{\rho_1^2} \int_\Omega |\nabla \varphi| |\nabla \mu| |\Delta^2 \varphi| + \frac{\varepsilon}{\rho_1^2} \int_\Omega |\Delta \varphi| |\mu| |\Delta^2 \varphi| \]

+ \left| \int_\Omega u \cdot \nabla \varphi \Delta^2 \varphi \right| + U \left| \int_\Omega v_\lambda \cdot \nabla \varphi \Delta^2 \varphi \right|. \tag{3.50} \]

Then, if we denote by \( J_1, \ldots, J_7 \) the seven terms of the right-hand side of this inequality, we have

\[ J_1 \leq C\varepsilon |\nabla \varphi|_\infty \left| \nabla \left( \frac{\mu}{\rho} \right) \right|_2 |\Delta^2 \varphi|_2 \leq C\varepsilon |\nabla \Delta \varphi|_2 \left| \nabla \left( \frac{\mu}{\rho} \right) \right|_2 |\Delta^2 \varphi|_2 \]

\[ \leq \frac{\alpha}{10\rho_1^3} |\Delta^2 \varphi|_2^2 + C\varepsilon^2 |\nabla \Delta \varphi|_2^2 \left| \nabla \left( \frac{\mu}{\rho} \right) \right|_2^2. \tag{3.51} \]

The second term is estimated as in [5], to obtain for \( q > 0 \)

\[ J_2 \leq \frac{\alpha}{10\rho_1^3} |\Delta^2 \varphi|_2^2 + C|\nabla \varphi|_2^{4/3} (1 + |\nabla \varphi|_2^q). \tag{3.52} \]

For the third term we get with (3.13)

\[ J_3 \leq C\varepsilon |\nabla \varphi|_6^2 |\mu - m(\mu)|_6 |\Delta^2 \varphi|_2 + C\varepsilon |m(\mu)| |\nabla \varphi|_2^2 |\Delta^2 \varphi|_2 \]

\[ \leq \frac{\alpha}{10\rho_1^3} |\Delta^2 \varphi|_2^2 + C\varepsilon^2 |\Delta \varphi|_2^4 (1 + |\nabla \mu|_2^2 + |\nabla \varphi|_2^2 p). \tag{3.53} \]

The next two terms are controlled as follows

\[ J_4 \leq C\varepsilon |\nabla \varphi|_\infty |\nabla \mu|_2 |\Delta^2 \varphi|_2 \leq \frac{\alpha}{10\rho_1^3} |\Delta^2 \varphi|_2^2 + C\varepsilon^2 |\nabla \Delta \varphi|_2^2 |\nabla \mu|_2^2. \tag{3.54} \]

and

\[ J_5 \leq C\varepsilon |\Delta \varphi|_3 |\mu - m(\mu)|_6 |\Delta^2 \varphi|_2 + C\varepsilon |m(\mu)| |\Delta \varphi|_2 |\Delta^2 \varphi|_2 \]

\[ \leq \frac{\alpha}{10\rho_1^3} |\Delta^2 \varphi|_2^2 + C\varepsilon^2 |\nabla \mu|_2^2 |\nabla \Delta \varphi|_2^2 + C\varepsilon^2 (1 + |\nabla \varphi|_2^2 p)|\Delta \varphi|_2^2. \tag{3.55} \]

If we use the Agmon-like inequality

\[ |\nabla \varphi|_\infty \leq C|\nabla \varphi|_2^{1/2} |\Delta^2 \varphi|_2^{3/2}, \]

we have

\[ J_6 \leq |u|_2 |\nabla \varphi|_\infty |\Delta \varphi|_2 \leq C|u|_2 |\nabla \varphi|_2^{1/2} |\Delta^2 \varphi|_2^{3/2} \]

\[ \leq \frac{\alpha}{10\rho_1^3} |\Delta^2 \varphi|_2^2 + C|\nabla \varphi|_2^2 |u|_2^2. \tag{3.56} \]

and

\[ J_7 \leq \frac{\alpha}{10\rho_1^3} |\Delta^2 \varphi|_2^2 + C|\nabla \varphi|_2^2. \tag{3.57} \]
Finally, the energy estimate reads
\[
\frac{1}{2} \frac{d}{dt} |\Delta \varphi|^2 + \frac{\alpha}{10 \rho^2} |\Delta^2 \varphi|^2 \leq C \varepsilon^2 |\nabla \Delta \varphi|^2 \left( |\nabla \mu|_2^2 + \left| \nabla \left( \frac{\mu}{\rho} \right) \right|_2^2 \right) + C |\nabla \varphi|_2^{1/3} \left( 1 + |\nabla \varphi|_2^2 \right) + C \varepsilon^2 (1 + |\nabla \varphi|_2^2) |\Delta \varphi|_2^2 + C |\nabla \varphi|_2^2 |u|_2^4,
\]
which can be also written using (3.47), (3.48)
\[
\frac{1}{2} \frac{d}{dt} |\Delta \varphi|^2 + \frac{\alpha}{10 \rho^2} |\Delta^2 \varphi|^2 \leq f_\varepsilon(t),
\] (3.58)
where \( f_\varepsilon(t) \) is bounded in \( L^1(t_0, t_0 + \tau) \) uniformly in \( \varepsilon \) and \( t_0 \geq 0 \), for any \( \tau > 0 \). But we also know by (3.48) that \( \Delta \varphi \) is bounded in \( L^2(t_0, t_0 + \tau, L^2) \) independently in \( t_0 \) and \( \varepsilon \).

We can conclude by the uniform Gronwall lemma that
\[
\| \varphi \|_{L^\infty(\mathbb{R}^+, \Phi_2)} \leq C, \quad \| \varphi \|_{L^2(t_0, t_0 + \tau; \Phi_4)} \leq C(\tau),
\] (3.59)
where \( C, C(\tau) \) are independent of \( \varepsilon \).

Step 3. We have now to obtain more regularity on the velocity. We multiply Navier–Stokes equation (3.7) by \( \partial u / \partial t \) so that after integration we obtain
\[
\rho_1 \frac{\partial |u|^2}{\partial t} + \frac{\partial}{\partial t} \left( \int \eta(\varphi)|D(u)|^2 \right) \leq \int \rho (u, \nabla) \frac{\partial u}{\partial t} \frac{\partial u}{\partial t} \left. \right| _\Omega + \int \eta(\varphi) \frac{\partial |u|^2}{\partial t} \left. \right| _\Omega + \int \rho (u, \nabla) \frac{\partial u}{\partial t} \left. \right| _\Omega + \int \rho g \frac{\partial u}{\partial t} \left. \right| _\Omega,
\]
A parameter \( \gamma \) given being given (which will be fixed in the sequel), each term of this inequality can be easily estimated to give
\[
\frac{\partial}{\partial t} \left( \int \eta(\varphi)|D(u)|^2 \right) + \frac{\rho_1}{10} \frac{\partial |u|^2}{\partial t} \leq \frac{\gamma}{20} |Au|_2^2 + \frac{\alpha}{20 \rho^2} \left| \nabla \frac{\partial \varphi}{\partial t} \right|_2^2 + \frac{1}{\gamma} I + C |\nabla u|_2^2 + C |\Delta v_\lambda|_2^2 |\nabla u|_2^2 + C |\nabla \varphi|_2^2 |D(v_\lambda)|_2^2 + C U^2 |\Delta v_\lambda|_2^2 + C (1 + \| \varphi \|_2^2) \left| \nabla \left( \frac{\mu}{\rho} \right) \right|_2^2 + C |g|_2^2,
\] (3.60)
where the term \( I \) is defined by
\[
I = \begin{cases} 
C |u|_2^2 |\nabla u|_2^2, & \text{if } d = 2, \\
C |\nabla u|_2^6, & \text{if } d = 3.
\end{cases}
\] (3.61)
Estimate (3.60) must be supplied with a control on the $H^2$-norm of $u$, that’s the reason why we have to multiply the Navier–Stokes equation by the value of the Stokes operator $Au = -\Delta u + \nabla \pi$ to get

\[- \int \eta(\varphi) \Delta u.Au = 2 \int \nabla(\varphi)(D(u) \cdot \nabla \varphi).Au + 2U \int \nabla(\varphi)(D(v_\lambda) \cdot \nabla \varphi).Au
+ U \int \eta(\varphi) \Delta v_\lambda.Au - \int \rho \frac{\partial u}{\partial t}.Au
- \int \rho (u \cdot \nabla)Au - \int \rho (v_\lambda \cdot \nabla)Au - U \int \rho (u \cdot \nabla)v_\lambda.Au
+ \int \mu \nabla \varphi.Au + \epsilon \int \frac{1 - \varphi^2}{4} \nabla \left( \frac{\mu}{\rho} \right).Au + \int \rho g.Au,\]

and so

\[\eta_1 |Au|_2^2 \leq \int \eta(\varphi) \nabla \pi.Au + C \int |D(u)||\nabla \varphi||Au|
+ CU \int |D(v_\lambda)||\nabla \varphi||Au| + CU \int |\Delta v_\lambda||Au| + C \int \frac{\partial u}{\partial t}.|Au|
+ C \int |u||\nabla u||Au| + CU \int |v_\lambda||\nabla u||Au| + CU \int |u||\nabla v_\lambda||Au|
+ \int |\mu - m(\mu)||\nabla \varphi||Au| + \epsilon \int \left| \frac{1 - \varphi^2}{4} \right| \nabla \left( \frac{\mu}{\rho} \right).|Au| + C \int |g||Au|.\]

The first term of the right-hand side member of this inequality reads after integration par parts (remember that $\text{div}(Au) = 0$ and $Au \cdot v = 0$ on the boundary) and using (2.3)

\[\left| \int \eta(\varphi) \nabla \varphi.Au \right| = \left| \int \eta'(\varphi) \nabla \varphi.Au \right|
\leq C |\varphi|_2 |\nabla \varphi|_\infty |Au|_2 \leq \frac{\eta_1}{10} |Au|_2^2 + C |\nabla \varphi|_2^2 |\nabla u|_2^2,\]

the other terms being easily estimated, one gets

\[\frac{\eta_1}{10} |Au|_2^2 \leq C |\nabla \varphi|_2^2 |\nabla u|_2^2 + CU^2 |D(v_\lambda)|_2^2 |\nabla \varphi|_2^2 + C \left| \frac{\partial u}{\partial t} \right|_2^2 + I
+ C |\nabla u|_2^2 + C |\Delta v_\lambda|_2^2 |\nabla u|_2^2 + C |\nabla \mu|_2^2 |\Delta \varphi|_2^2
+ CE^2 (1 + \|\varphi\|_2^2) \left| \nabla \left( \frac{\mu}{\rho} \right) \right|_2^2 + C |g|_2^2,\]

(3.62)

the term $I$ being always defined by (3.61).

If now we choose the value of the parameter $\gamma$ (independently of $\epsilon$) so that $\gamma C \leq \frac{\eta_1}{20}$, we get by summing (3.60) and $\gamma \ast (3.62)$ and using (3.59)
\[
\frac{\partial}{\partial t} \left( \int_\Omega \eta(\phi) |D(u)|^2 \right) + \frac{\rho_1}{20} \left| \frac{\partial u}{\partial t} \right|_2^2 + \gamma \frac{\eta_1}{20} |Au|^2_2 \\
\leq \frac{\alpha}{20\rho_2} \left| \nabla \frac{\partial \phi}{\partial t} \right|_2^2 + \left( \frac{1}{\gamma} + \frac{1}{\gamma} \right) I + C |\nabla u|^2_2 + C |\Delta v|^2_2 |\Delta u|^2_2 \\
+ C |\nabla \Delta \phi|^2_2 |D(v)|^2_2 + C U^2 |\Delta v|^2_2 + C(1 + \|\phi\|_2^2) \left| \nabla \left( \frac{\mu}{\rho} \right) \right|^2_2 \\
+ C \gamma |\nabla \Delta \phi|^2_2 |\nabla \phi|^2_2 + C \gamma U^2 |D(v)|^2_2 |\nabla \phi|^2_2 + C |\phi|^2_2,
\]

\[\leq \frac{\alpha}{20\rho_2} \left| \nabla \frac{\partial \phi}{\partial t} \right|_2^2 + \left( \frac{1}{\gamma} + \frac{1}{\gamma} \right) I + C + C |\nabla u|^2_2 + C \left| \nabla \left( \frac{\mu}{\rho} \right) \right|^2_2. \quad (3.63)\]

Unfortunately, this estimate is not sufficient to conclude. Indeed, because of the first term in the right-hand side member of this inequality, we must now derive estimates on \(\frac{\partial \phi}{\partial t}\) in \(H^1\) independently of \(\varepsilon\).

**Step 4.** The Cahn–Hilliard equation (3.5) gives us

\[\left| \frac{\partial \phi}{\partial t} \right|_2^2 \leq |u|^2_2 |\nabla \phi|_\infty^2 + U^2 |\nabla \phi|^2_2 + \left| \text{div} \left( \frac{1}{\rho} \nabla \left( \frac{\mu}{\rho} \right) \right) \right|^2_2,\]

and with the same computations than for the estimates (3.51)–(3.57), we deduce that

\[\left\| \frac{\partial \phi}{\partial t} \right\|_{L^2(t_0, t_0 + \tau; L^2)} \leq C(\tau), \quad (3.64)\]

independently of \(t_0\) and \(\varepsilon\). This result is clearly stronger than (3.48).

**Step 5.** We come back to the inequality (3.11) which gives us

\[\frac{1}{2} \frac{\partial}{\partial t} \left( \int_\Omega \frac{1}{\rho} \left| \nabla \left( \frac{\mu}{\rho} \right) \right|^2 \right) + \frac{\alpha}{\rho_2} \left| \nabla \frac{\partial \phi}{\partial t} \right|_2^2 \\
\leq C \varepsilon \int_\Omega \left| \frac{\partial \phi}{\partial t} \right| \left| \nabla \phi \right| \left| \nabla \phi \right| + C \varepsilon \int_\Omega \left| \Delta \phi \right| \left| \frac{\partial \phi}{\partial t} \right| + C \int_\Omega \left| F''(\phi) \right| \left| \frac{\partial \phi}{\partial t} \right| \\
+ C \varepsilon \int_\Omega \left| F'(\phi) \right| \left| \frac{\partial \phi}{\partial t} \right|^2 + C \varepsilon \int_\Omega \nabla \left( \frac{\mu}{\rho} \right) \left| \frac{\partial \phi}{\partial t} \right| \\
+ \left| \int_\Omega (u \cdot \nabla \phi) \frac{\partial}{\partial t} \left( \frac{\mu}{\rho} \right) \right| + \left| \int_\Omega (v \cdot \nabla \phi) \frac{\partial}{\partial t} \left( \frac{\mu}{\rho} \right) \right|. \quad (3.65)\]

We estimate the seven terms \(K_1, \ldots, K_7\) of this inequality in the following way

\[K_1 \leq C \varepsilon \left| \frac{\partial \phi}{\partial t} \right|_2 \left| \nabla \phi \right|_\infty^2 \leq \frac{\alpha}{10\rho_2} \left| \nabla \frac{\partial \phi}{\partial t} \right|_2^2 + C \varepsilon^2 \left| \nabla \Delta \phi \right|_2^2 \left| \frac{\partial \phi}{\partial t} \right|_2^2, \quad (3.66)\]

\[K_2 \leq C \varepsilon \left| \Delta \phi \right|_2 \left| \frac{\partial \phi}{\partial t} \right|_2 \leq C \varepsilon \left| \nabla \Delta \phi \right|_2 \left| \frac{\partial \phi}{\partial t} \right|_2 \left| \nabla \phi \right|_2.\]
\[
\leq \frac{\alpha}{10 \rho_2} \left| \nabla \frac{\partial \varphi}{\partial t} \right|^2 + C \varepsilon^2 |\nabla \Delta \varphi|^2 \left| \frac{\partial \varphi}{\partial t} \right|^2, \tag{3.67}
\]

\[
K_3 \leq C |F''(\varphi)|_{\infty} \left| \frac{\partial \varphi}{\partial t} \right|^2 \leq C (1 + |\varphi|^{p-1}) \left| \frac{\partial \varphi}{\partial t} \right|^2 \leq C (1 + \|\varphi\|_{L^2}) \left| \frac{\partial \varphi}{\partial t} \right|^2, \tag{3.68}
\]

\[
K_4 \leq C \varepsilon |F'(\varphi)|_{\infty} \left| \frac{\partial \varphi}{\partial t} \right|^2 \leq C \varepsilon (1 + \|\varphi\|_{L^2}) \left| \frac{\partial \varphi}{\partial t} \right|^2, \tag{3.69}
\]

\[
K_5 \leq C \varepsilon \left| \nabla \left( \frac{\mu}{\rho} \right) \right|^2 \left| \frac{\partial \varphi}{\partial t} \right|^2 \leq C \varepsilon \left| \nabla \left( \frac{\mu}{\rho} \right) \right|^2 \Delta \left( \frac{\mu}{\rho} \right) \left| \frac{\partial \varphi}{\partial t} \right|^2 \left| \nabla \varphi \right|^2.
\]

The sixth term is estimated just like the term \( I_{10} \) (see (3.32)), in the proof of Theorem 3.2

\[
K_6 \leq \frac{\alpha}{10 \rho_2} \left| \nabla \frac{\partial \varphi}{\partial t} \right|^2 + C |u|_2 |\nabla \varphi|_2 + |\nabla \varphi|_{L^2} |\Delta \varphi|_{L^2} |\nabla u|_2 + C |\Delta \varphi|_{L^2} |\nabla u|_2 + |\nabla \varphi|_{L^2} |\Delta \varphi|_{L^2} |\nabla u|_2 + C |\Delta \varphi|_{L^2} |\nabla u|_2, \tag{3.71}
\]

and in the same way

\[
K_7 \leq C U |\nabla \varphi|_2 |F''(\varphi)|_{\infty} + \varepsilon |F'(\varphi)|_{\infty} \left| \frac{\partial \varphi}{\partial t} \right|^2 + C U^2 \varepsilon |\Delta \varphi|_{L^2} |\nabla u|_2 ^2 + C U^2 \varepsilon |\nabla \varphi|_{L^2} |\nabla \Delta \varphi|_{L^2}. \tag{3.72}
\]

Thanks to (3.47) and (3.59), inequality (3.65) leads to

\[
\frac{1}{2} \frac{\partial}{\partial t} \left( \int_{\Omega} \left| \frac{1}{\rho} \nabla \left( \frac{\mu}{\rho} \right) \right|^2 \right) + \frac{\alpha}{10 \rho_2} \left| \nabla \frac{\partial \varphi}{\partial t} \right|^2 \leq C + C \left| \nabla \Delta \varphi \right|_2 + C |\nabla \varphi|_2 + C |\nabla \varphi|_2 |\nabla \Delta \varphi|_2 + C \varepsilon^2 \left| \Delta \left( \frac{\mu}{\rho} \right) \right|_2 \left| \nabla \left( \frac{\mu}{\rho} \right) \right|_2. \tag{3.73}
\]

**Step 6.** We have now collected all the inequalities we need to conclude. Indeed, if we sum (3.63) and (3.73) we get

\[
\frac{1}{2} \frac{\partial}{\partial t} \left( \int_{\Omega} \left| \frac{1}{\rho} \nabla \left( \frac{\mu}{\rho} \right) \right|^2 \right) + \int_{\Omega} \frac{\alpha}{20 \rho_2} \left| \nabla \frac{\partial \varphi}{\partial t} \right|^2 + \frac{\rho_1}{20} \left| \frac{\partial u}{\partial t} \right|^2 + \frac{\eta_1}{20} |A u|^2 \leq g_1(t) + g_2(t) |\nabla u|_2 ^2 + |\nabla \mu|_2 ^2 + \left( \frac{1}{\gamma} + \gamma \right) I, \tag{3.74}
\]

where \( g_1(t) \) and \( g_2(t) \) are two functions bounded in \( L^1(t_0, t_0 + \tau) \) independently of \( \varepsilon \) and \( t_0 \) for any \( \tau > 0 \). More precisely, this last fact comes from (3.36) and (3.64).

The conclusion is now straightforward with (3.48).
If the dimension is \( d = 2 \), the term \( I \) (see (3.61)) is of the form \( g_3(t) |\nabla u|^2 \) with \( g_3(t) \) bounded in \( L^1(t_0, t_0 + \tau) \) independently of \( t_0 \) and \( \varepsilon \). We obtain the desired regularity and globality from the uniform Gronwall lemma.

If the dimension is \( d = 3 \), as for the simple Navier–Stokes equation, the term \( I = C |\nabla u|^6 \) limits the estimates to be local using the Gronwall lemma.

In each case, the estimates obtained are independent of \( \varepsilon \) and in particular, in the 3D case, the existence time of the solution is independent of \( \varepsilon \).

\[ \square \]

3.3. Asymptotic behavior

We are interested here in proving a result of asymptotic stability for the metastable states, as in [5], but in the case of nonhomogeneous fluids. In this subsection we have to suppose that the external force term \( g \) is derived from a potential. That is to say we suppose that there exists \( G \in L^2 \) such that

\[ g = \nabla G. \] (3.75)

One can think of \( g \) as a gravity forces term.

**Theorem 3.4.** – Let \( \omega \in \mathbb{R} \), and suppose that \( F''(\omega) > 0 \) (we say that \( \omega \) is a metastable state of the potential \( F \)). Then there exists \( \varepsilon_0 > 0 \), satisfying

\[ \varepsilon_0 < \frac{F''(\omega)}{|F'(\omega)| \rho_1}, \]

and a \( \delta_0 > 0 \) such that for any \( \delta < \delta_0 \) and any data \( U > 0, v_0 \in v_\infty^U + V, \varphi_0 \in \Phi_3 \), with \( m(\varphi_0) = \omega \), satisfying

\[ U + \|v_0\|_1 + \|\varphi_0 - \omega\|_3 \leq \delta, \]

there exists for any \( \varepsilon < \varepsilon_0 \), a unique global strong solution \((\varphi_\varepsilon, v_\varepsilon)\) of problem (1.1)–(1.4) (even in 3D) with the initial data \((\varphi_0, v_0)\). Moreover, if \( \delta > 0 \) is small enough, this solution satisfies

\[ \varphi_\varepsilon(t) \to \omega, \ v_\varepsilon(t) \to v_\infty^U, \ \text{when} \ t \to +\infty. \]

**Proof.** – **Step 1.** First of all, we have to change the Cahn–Hilliard potential we work with. More precisely, we introduce a function \( R_\varepsilon(x) \) such that \( R_\varepsilon(\omega) = 0 \) and \( R'_\varepsilon = \rho_\varepsilon \). Then we construct, near the point \( x = \omega \) a function \( F_\omega \) given, \( \xi > 0 \) small enough being fixed, by

\[ F_\omega(x) = F(x) - \frac{F'(\omega)}{\rho_\varepsilon(\omega)} R_\varepsilon(x) - F(\omega), \ \forall x \in [\omega - \xi, \omega + \xi]. \]

One can easily show that we have

\[ F_\omega(\omega) = 0, \ F'_\omega(\omega) = 0, \ F''_\omega(\omega) > 0, \]
this last condition being ensured because \( F''(\omega) > 0 \) and \( \varepsilon \) is chosen so that
\[
\varepsilon < \frac{F''(\omega)}{|F'(\omega)|\rho_1}.
\]

This function \( F_\omega \) is strictly convex near \( \omega \), so that it is easy to extend \( F_\omega \) to be defined and convex on \( \mathbb{R} \), and to satisfy assumptions (2.8)–(2.11).

A very important point, is that in the assumption (2.10), we can take \( F_4(\omega) = 0 \) (because \( F_\omega \) is convex, and \( F_\omega(\omega) = 0 \)).

**Step 2.** We perform the same estimates than in the proof of Theorem 3.2 with this new potential \( F_\omega \), excepted for the term \( I_3 \) which can be written thanks to (3.75)
\[
|I_3| = \left| \int \rho \nabla G \rho \right| = \left| \int G \rho' \nabla (\rho - m(\varphi)) \rho \right| 
\leq \varepsilon |G|_2 |\Delta \varphi|_2 |\nabla u|_2 \leq C \varepsilon z_\varepsilon. \quad (3.76)
\]

Using this new estimate, inequality (3.44) becomes
\[
\frac{\partial}{\partial t} y_\varepsilon + \frac{1}{4} z_\varepsilon \leq C U^2 |D(v_\rho)|^2 + C \varepsilon^{1/2} z_\varepsilon + C \lambda U z_\varepsilon + C \varepsilon^{1/8} (1 + y_\varepsilon^2) z_\varepsilon. \quad (3.77)
\]

Indeed, we have \( F_4(\omega) = 0 \) in (3.12) and (3.15), and the constant which appears in (3.22) is no more present in the new estimate of \( I_3 \) (3.76).

We recall that we can take
\[
\lambda = \min \left( \frac{1}{16 C U}, \sqrt[4]{U} \right),
\]
so that with (3.4) we have
\[
f_1(U) \equiv C U^2 |D(v_\rho)|^2 \to 0, \quad \text{when } U \to 0.
\]

From now on, \( f_i \) will always denote a real positive continuous function satisfying \( f_i(0) = 0 \). We follow the proof as the one of Theorem 3.2 to get, if we suppose \( \varepsilon < 1/(16 C)^2 \),
\[
\frac{d}{dt} y_\varepsilon + \frac{1}{8} z_\varepsilon \leq f_1(U) + C \varepsilon^{1/8} (1 + y_\varepsilon^2) z_\varepsilon,
\]
and finally introducing the same \( M_\varepsilon \) we have that, if \( \varepsilon \) is small enough so that \( K \delta \leq \frac{1}{2} M_\varepsilon \) then we have for any time \( t \) the estimate
\[
\frac{d}{dt} y_\varepsilon + \frac{1}{16} z_\varepsilon \leq f_1(U),
\]
and so with (3.18)
\[
\frac{d}{dt} y_\varepsilon + C' y_\varepsilon \leq f_1(U).
\]
Finally, using the assumption on the data, we deduce from the Gronwall lemma

\[ y(t) \leq K\delta + \frac{f_1(U)}{C'} = f_2(\delta), \]

where we used the fact that \( U \leq \delta \). We deduce easily that

\[
\|\phi - \omega\|_{L^\infty(\mathbb{R}^+; \Phi_3)} + \frac{\varepsilon}{1/2} \|\phi - \omega\|_{L^\infty(\mathbb{R}^+; \Phi_2)} + \varepsilon^{3/4} \|\phi - \omega\|_{L^\infty(\mathbb{R}^+; \Phi_1)}
+ \|v - v^U\|_{L^\infty(\mathbb{R}^+; H)} \leq f_2(\delta),
\]

(3.78)

\[
\|\phi - \omega\|_{L^2(\tau, T; \Phi_3)} + \varepsilon^{1/2} \left\| \frac{\partial \phi}{\partial t} \right\|_{L^2(\tau, T; \Phi_1)} + \frac{\varepsilon^{3/4}}{1/2} \left\| \frac{\partial \phi}{\partial t} \right\|_{L^2(\tau, T; \Phi_1)}
+ \|v - v^U\|_{L^2(\tau, T; V)} \leq (1 + \tau) f_2(\delta), \quad \text{for any } \tau > 0.
\]

(3.79)

Step 3. We perform the same estimate than (3.50) to obtain

\[
\frac{1}{2} \frac{d}{dt} |\Delta \phi|^2 + \frac{\alpha}{10\rho^2} |\Delta^2 \phi|^2 \leq f_3^\delta(t),
\]

where \( f_3^\delta \) is estimated independently of \( \varepsilon \) in the following way using (3.78), (3.79):

\[
\|f_3^\delta\|_{L^1(\tau, T; \Phi_3)} \leq (1 + \tau) f_3(\delta).
\]

We can deduce of this estimate, using the uniform Gronwall lemma that

\[
\|\phi - \omega\|_{L^\infty(\mathbb{R}^+; \Phi_3)} \leq f_4(\delta), \quad \|\phi - \omega\|_{L^2(\tau, T; \Phi_4)} \leq (1 + \tau) f_4(\delta).
\]

(3.80)

As \( H^2 \) is embedded in \( L^\infty \) (in both dimensions \( d = 2, d = 3 \)), we deduce from (3.80) that

\[
\|\phi - \omega\|_{L^\infty(\mathbb{R}^+ \times \Omega)} \leq f_4(\delta),
\]

so that if we choose \( \delta_0 \) small enough and \( \delta < \delta_0 \) we have

\[ f_4(\delta) < \xi, \]

and so for almost every \( (t, x) \), \( \phi(t, x) \) lies in the interval \( [\omega - \xi, \omega + \xi] \) where the potential is defined by

\[ F_\omega(x) = F(x) - \frac{F'(\omega)}{\rho_\omega(\omega)} R_\varepsilon(x) - F(\omega). \]

That is to say that \( \phi \) is solution of

\[
\frac{\partial \phi}{\partial t} + v \cdot \nabla \phi - \text{div} \left( \frac{1}{\rho_\omega(\phi)} \nabla \left( -\alpha \Delta \phi + \frac{F'(\phi)}{\rho_\omega(\phi)} \right) \right) = 0,
\]

\[
\frac{\partial \phi}{\partial t} + v \cdot \nabla \phi - \text{div} \left( \frac{1}{\rho_\omega(\phi)} \nabla \left( \frac{1}{\rho_\omega(\phi)} \left( -\alpha \Delta \phi + F'(\phi) - \frac{F'(\omega)}{\rho_\omega(\omega)} \rho_\omega(\phi) \right) \right) \right) = 0,
\]

\[
\frac{\partial \phi}{\partial t} + v \cdot \nabla \phi - \text{div} \left( \frac{1}{\rho_\omega(\phi)} \nabla \left( -\alpha \Delta \phi + F'(\phi) \right) \right) = 0.
\]
One recognize here the initial equations (1.1), (1.2) with the potential $F$, and so finally, the solution we construct here is a solution of our problem (1.1)--(1.4).

Step 4. As the existence of a global strong solution in 2D is given by the Theorem 3.3, we only have to show that the solution obtained is a strong solution in velocity, defined globally in the 3D case. We are going to use the fact that the initial data is chosen near a stationary state.

If we let

$$h(t) = \int_\Omega \frac{1}{\rho} |\nabla \left( \frac{\mu}{\rho} \right) |^2 + \int_\Omega |\eta(\varphi)| D(u)^2,$$

estimate (3.74) reads in the 3D case

$$\frac{1}{2} \frac{d}{dt} h \leq g_1(t) + g_2(t) h(t) + Ch(t)^3,$$  \hspace{1cm} (3.81)

where $g_1$ and $g_2$ are bounded independently of $t_0$ and $\varepsilon$ in the following way

$$\int_{t_0}^{t_0+1} g_i(t) \, dt \leq f_5(\delta), \quad \text{for } i = 1, 2,$$

and thanks to (3.79) we also have

$$\int_{t_0}^{t_0+1} h(t) \, dt \leq f_5(\delta).$$

Moreover, thanks to the assumption on the data, there exists $C'$ such that

$$h(0) < C' \delta^2.$$

Now let us introduce

$$f_6(\delta) = (\max \{ C' \delta^2, f_5(\delta) \} + f_5(\delta)) e^{1+f_5(\delta)}.$$

It is straightforward to show that

$$f_6(\delta) \to 0, \quad \text{when } \delta \to 0.$$

Let us now choose, $\delta_0$ small enough so that $C_f(\delta)^2 < 1$ for any $\delta < \delta_0$. In those conditions, one have

$$Ch(0)^2 < 1.$$

If we denote by $T$ the maximal time such that

$$Ch(t)^2 < 1, \quad \forall t \in [0, T[,$$
we get from (3.81), for any \( t \in [0, T[ \),
\[
\frac{d}{dt} h \leq g_1(t) + (1 + g_2(t))h(t),
\]
so that, using the uniform Gronwall lemma, we have for any \( t \in [0, T[ \)
\[
h(t) \leq f_6(\delta).
\]
But, by the choice of \( \delta_0 \), we have \( C f_6(\delta)^2 < 1 \), which implies that the existence time \( T \) of the solution is \( +\infty \). Moreover, we deduce the following estimates on the solution \((\varphi, v)\)
\[
\| \varphi - m(\varphi) \|_{L^\infty(\mathbb{R}^+;\Phi_1)} + \| v - v^U \|_{L^\infty(\mathbb{R}^+;V)} \leq f_7(\delta),
\]
(3.82)
\[
\| \frac{\partial \varphi}{\partial t} \|_{L^2(t_0, t_0 + \tau; \Phi_1)} + \| \frac{\partial v}{\partial t} \|_{L^2(t_0, t_0 + \tau; H)} + \| v \|_{L^2(t_0, t_0 + \tau; V^2)} \leq f_7(\delta)(1 + \tau).
\]
We have shown the global and uniform in time existence of strong solutions for the problem (1.1)–(1.4).

Step 5. In the previous step, we have obtained the stability of the stationary solution we are studying. In order to show the asymptotic stability of this solution, we have to study the convergence of the solution when \( t \) tends to \( +\infty \).

First we study the convergence of the order parameter \( \varphi \). If one takes the scalar product of (1.1) with \( \varphi - m(\varphi) \) in \( L^2 \), one obtains using (1.4) and the boundary conditions on \( v \),
\[
\frac{d}{dt} | \varphi - m(\varphi) |^2 + \int_\Omega \frac{1}{\rho} \nabla \left( \frac{\mu}{\rho} \right) . \nabla \varphi = 0,
\]
which can be written, using the fact that \( \mu = -\alpha \Delta \varphi + F'_{\omega}(\varphi) \) (or \( F'(\varphi) \), it is strictly equivalent),
\[
\frac{d}{dt} | \varphi - m(\varphi) |^2 - \alpha \int_\Omega \frac{1}{\rho} \nabla \left( \frac{\Delta \varphi}{\rho} \right) . \nabla \varphi = - \int_\Omega \frac{1}{\rho} \nabla \left( \frac{F'_{\omega}(\varphi)}{\rho} \right) . \nabla \varphi.
\]
We get
\[
\frac{d}{dt} | \varphi - m(\varphi) |^2 + \int_\Omega \frac{1}{\rho^2} | \Delta \varphi |^2 \\
= \alpha \int_\Omega \frac{\rho^3(\varphi)}{\rho^3(\varphi)} | \Delta \varphi | \nabla \varphi |^2 - \int_\Omega \frac{1}{\rho^2} F''_{\omega}(\varphi) | \nabla \varphi |^2 + \int_\Omega \frac{F'_{\omega}(\varphi)}{\rho^3(\varphi)} | \nabla \varphi |^2,
\]
and so, using the fact that \( F_{\omega} \) is convex (by construction), and \( \varphi \) is bounded in \( L^\infty \), we deduce
\[
\frac{d}{dt} | \varphi - m(\varphi) |^2 + \frac{1}{\rho^2} | \Delta \varphi |^2 \leq C \varepsilon | \Delta \varphi |^2 + C \varepsilon | \nabla \varphi |^2 \leq C \varepsilon C f_4(\delta) | \Delta \varphi |^2 + C f_4(\delta) | \nabla \varphi |^2,
\]
because we have

\[ |F'_\omega(\varphi)| = |F'_\omega(\varphi) - F'_\omega(\omega)| \leq \left( \sup_{[\omega-\xi, \omega+\xi]} |F''_\omega(\varphi)| \right)|\varphi - \omega|, \]

that is to say with (3.80)

\[ |F'_\omega(\varphi)|_\infty \leq Cf_4(\delta). \]

If \( \delta \) is small enough such that \( 2Cf_4(\delta) \leq 1/(2\rho_2^2) \), we deduce that we have

\[ \frac{d}{dt} |\varphi - \omega|_2^2 + C|\Delta \varphi|_2^2 \leq 0, \]

which implies by (2.5) that

\[ \frac{d}{dt} |\varphi - \omega|_2^2 + C|\varphi - \omega|_2^2 \leq 0, \]

and finally

\[ |\varphi - \omega|_2^2 \leq |\varphi_0 - \omega|_2^2 e^{-Ct}, \]

which gives the desired convergence in \( \Phi_0 \). The convergence in \( \Phi_s \) for any \( s < 2 \) comes directly from the previous convergence and the fact that \( (\varphi - \omega) \) is bounded uniformly in time in \( \Phi_2 \).

**Step 6.** It remains to show the convergence of the velocity field. Let us write down the equation satisfied by \( v - v^U_\infty \) in the following way (remember that \( \Delta v^U_\infty = 0 \) and that \( g = \nabla G \))

\[
\rho(\omega) \left( \frac{\partial(v - v^U_\infty)}{\partial t} + (v - v^U_\infty) \cdot \nabla (v - v^U_\infty) \right) - 2 \text{div}(\eta(\varphi) D(v - v^U_\infty)) + \nabla p \\
= 2 \text{div}((\eta(\varphi) - \eta(\omega)) D(v^U_\infty)) - \rho(\omega)(v^U_\infty) \cdot \nabla (v - v^U_\infty) + (v - v^U_\infty) \cdot \nabla v^U_\infty \\
- (\rho(\varphi) - \rho(\omega)) \left( \frac{\partial v}{\partial t} + v \cdot \nabla v \right) + (\mu - m(\mu)) \nabla \varphi \\
+ \epsilon \left( \frac{1 - \varphi^2}{4} - \frac{1 - \omega^2}{4} \right) \nabla \left( \frac{\mu}{\rho} \right) + (\rho(\varphi) - \rho(\omega)) g,
\]

from which we deduce in a straightforward way

\[
\frac{\rho(\omega)}{2} \frac{d}{dt} \left( |v - v^U_\infty|_2^2 \right) + \eta |\nabla (v - v^U_\infty)|_2^2 \\
\leq 2 \int_{\Omega} |\eta(\varphi) - \eta(\omega)||D(v^U_\infty)||D(v - v^U_\infty)| \\
+ \rho(\omega) \int_{\Omega} |v^U_\infty| |v - v^U_\infty| |\nabla (v - v^U_\infty)| + \rho(\omega) \int_{\Omega} |v - v^U_\infty| |\nabla v^U_\infty|.
\]
\[
+ \int_{\Omega} \rho(\phi) - \rho(\omega) \left| \frac{\partial v}{\partial t} + v. \nabla v \right| |v - v_\infty^U| \\
+ \int_{\Omega} |\mu - m(\mu)| |\nabla \phi||v - v_\infty^U| + \epsilon \int_{\Omega} \left| \frac{\varphi^2 - \omega^2}{4} \right| \left| \nabla \left( \frac{\mu}{\rho} \right) \right| |v - v_\infty^U| \\
+ \left| \int_{\Omega} (\rho(\phi) - \rho(\omega)) g(v - v_\infty^U) \right|.
\]

This last inequality leads to
\[
\frac{\rho(\omega)}{2} \frac{\partial}{\partial t} \left( |v - v_\infty^U|^2 \right) + \eta_1 \left| \nabla (v - v_\infty^U) \right|^2 \\
\leq 2 \|\eta\|_2 |\phi - \omega| \|D(v_\infty^U)\|_2 \|\nabla (v - v_\infty^U)\|_2 + C |v_\infty^U|_\infty \|\nabla (v - v_\infty^U)\|_2 \\
+ C \|\nabla v_\infty^U\|_\infty |v - v_\infty^U|^2 + C \eta_1 |\phi - \omega|_\infty \left( \left| \frac{\partial v}{\partial t} \right|_2 + |\nabla v|_2 |A v|_2 \right) |v - v_\infty^U|_2 \\
+ C |\nabla \mu| \|\nabla \phi\|_2 |v - v_\infty^U|_2 + C \epsilon |\phi^2 - \omega^2|_\infty \left| \nabla \left( \frac{\mu}{\rho} \right) \right|_2 |v - v_\infty^U|_2 \\
+ C \epsilon |\phi - \omega|_\infty |g|_2 |v - v_\infty^U|_2. \tag{3.83}
\]

Using (2.3), (3.80), (3.82) and the fact that
\[
|v_\infty^U|_\infty = |\nabla v_\infty^U|_\infty = U \leq \delta,
\]
we obtain, for \(\delta\) small enough, the estimate
\[
\frac{\partial}{\partial t} \left( |v - v_\infty^U|^2 \right) + |v - v_\infty^U|^2 \leq g_1(t) + C' e^{-C't} g_2(t),
\]
where \(g_1(t) \to 0\) when \(t\) goes to infinity, and \(g_2\) is given by
\[
g_2(t) = \left| \frac{\partial v}{\partial t} \right|_2^2 + |A v|_2^2 + |\nabla \mu|_2^2 + \left| \nabla \left( \frac{\mu}{\rho} \right) \right|_2^2.
\]

so that we have thanks to (3.79) and (3.82)
\[
\int_0^t g_2(s) ds \leq C(1 + t).
\]

We can suppose that \(C_1 < 1\), then we show that any function \(y(t)\) satisfying
\[
y'(t) + y(t) \leq g_1(t) + C e^{-C_1 t} g_2(t),
\]
necessarily tends to zero when \(t\) goes to infinity. Indeed, we have
\[
y(t) \leq e^{-t} y(0) + e^{-t} \int_0^t e^{s} g_1(s) ds + C e^{-t} \int_0^t e^{(1-C_1)s} g_2(s) ds.
\]
In this inequality it is clear that the first term converges towards zero, but also the second term using the Cesaro theorem and the fact that $g_2(t) \to 0$. As far as the third term is concerned, we have

\[ e^{-t} \int_0^t e^{(1-C_1)s} g_2(s) \, ds = e^{-t} e^{(1-C_1)\tau} \int_0^\tau g_2(s) \, ds \leq C e^{-C_1t} (1+t). \]

The conclusion is straightforward: the velocity field converges towards the stationary velocity field in $H$ and so in $V_s$ for any $s < 1$ because we have shown that $(v - v_\infty)$ is bounded uniformly in time in the space $V$.
