**A HOMOLOGICAL EXACT SEQUENCE ASSOCIATED WITH  
 A FAMILY OF NORMAL SUBGROUPS**  
 by Antonio G. RODICIO

**Résumé.** R. Brown et J.-L. Loday ont obtenu, par des méthodes topologiques, une suite exacte de 8 termes qui relie l'homologie d'un groupe  $G$  avec l'homologie de deux de ses sous-groupes normaux  $M$  et  $N$  tels que  $MN = G$ . Ici on démontre que les cinq premiers termes de cette suite peuvent être obtenus pour une famille de sous-groupes  $\{M_i \mid 1 \leq i \leq n\}$  telle que

$$M_k(\bigcap_{i \neq k} M_i) = G.$$

**Introduction.**

In this paper we prove the following theorems:

**THEOREM 1.** *Let  $A$  be a ring (with unit) and  $I$  a two-sided ideal of  $A$ . Let  $\{J_i \mid 1 \leq i \leq n\}$  be a finite family of two-sided ideals of  $A$  such that*

$$J_k + (\bigcap_{i \neq k} J_i) = I, \quad 1 \leq k \leq n.$$

*Then there exists an exact and natural sequence*

$$(1) \quad \text{Tor}_2^A(A/I, A/I) \rightarrow \bigoplus_{i=1}^n \text{Tor}_2^{A/J_i}(A/I, A/I) \rightarrow (\bigcap_{i=1}^n J_i) / \sum_{k=1}^n (\bigcap_{i \neq k} J_i) J_k \rightarrow \text{Tor}_1^A(A/I, A/I) \rightarrow \bigoplus_{i=1}^n \text{Tor}_1^{A/J_i}(A/I, A/I) \rightarrow 0.$$

**THEOREM 2.** *Let  $G$  be a group and  $\{M_i \mid 1 \leq i \leq n\}$  a finite family of normal subgroups of  $G$ , such that*

$$M_k(\bigcap_{i \neq k} M_i) = G, \quad 1 \leq k \leq n.$$

*Then there exists an exact and natural sequence*

$$(2) \quad \begin{array}{l} H_2(G) \rightarrow \bigoplus_{i=1}^n H_2(G/M_i) \rightarrow (\bigcap_{i=1}^n M_i) / \langle [\bigcap_{i \neq k} M_i, M_k] \mid 1 \leq k \leq n \rangle \rightarrow \\ H_1(G) \rightarrow \bigoplus_{i=1}^n H_1(G/M_i) \longrightarrow 0 \end{array}$$

where  $\langle [\bigcap_{i \neq k} M_i, M_k] \mid 1 \leq k \leq n \rangle$  is the subgroup of  $G$  generated by the subgroups  $[\bigcap_{i \neq k} M_i, M_k]$ ,  $1 \leq k \leq n$ .

If  $J_i = I$ ,  $3 \leq i \leq n$ , then Theorem 1 yields Theorem 1 of [2]. On the other hand, if  $M_i = G$ ,  $3 \leq i \leq n$ , then sequence (2) yields the five first terms of the eight-term exact sequence obtained in [1] by topological methods.

### Proof of the theorems.

We will systematically use the following result: If  $N$  is a submodule of an  $A$ -module  $M$ , then the sequence

$$N \otimes_A M \oplus M \otimes_A N \rightarrow M \otimes_A M \rightarrow M/N \otimes_A M/N \rightarrow 0$$

is exact.

For each  $k$ ,  $1 \leq k \leq n$ , we have a short exact sequence

$$\bigcap_{i=1}^n J_i \rightarrow \bigcap_{i \neq k} J_i \rightarrow (\bigcap_{i \neq k} J_i) / (\bigcap_{i=1}^n J_i) \simeq I/J_k$$

which yields a right exact sequence

$$(\bigcap_{i=1}^n J_i) \otimes_A (\bigcap_{i \neq k} J_i) \oplus (\bigcap_{i \neq k} J_i) \otimes_A (\bigcap_{i=1}^n J_i) \rightarrow (\bigcap_{i \neq k} J_i) \otimes_A (\bigcap_{i \neq k} J_i) \rightarrow (I/J_k) \otimes_A (I/J_k) \rightarrow 0.$$

Therefore we obtain the right exact sequence

$$(3) \quad \begin{array}{l} \bigoplus_{k=1}^n ((\bigcap_{i=1}^n J_i) \otimes_A (\bigcap_{i \neq k} J_i) \oplus (\bigcap_{i \neq k} J_i) \otimes_A (\bigcap_{i=1}^n J_i)) \rightarrow \bigoplus_{k=1}^n ((\bigcap_{i \neq k} J_i) \otimes_A (\bigcap_{i \neq k} J_i)) \\ \rightarrow \bigoplus_{k=1}^n ((I/J_k) \otimes_A (I/J_k)) \rightarrow 0. \end{array}$$

We now consider the sequence

$$(4) \quad \bigoplus_{k=1}^n (\bigcap_{i=1}^n J_i) \xrightarrow{\mu} \bigoplus_{k=1}^n (\bigcap_{i \neq k} J_i) \xrightarrow{\epsilon} I$$

where

$$\mu(a_1, a_2, \dots, a_{n-1}) = (a_1, a_2, \dots, a_{n-1}, -(a_1 + a_2 + \dots + a_{n-1}))$$

and

$$\epsilon(b_1, b_2, \dots, b_n) = b_1 + b_2 + \dots + b_n.$$

It is clear that  $\mu$  is injective and  $\text{Ker } \epsilon = \text{Im } \mu$ . Moreover  $\epsilon$  is surjective as a consequence of  $I = \sum_{k=1}^n (\bigcap_{i \neq k} J_i)$ . Then the sequence (4) induces the right exact sequence

$$(5) \quad \begin{aligned} & (\oplus_{k=i}^{n-1} (\cap_{j \neq k} J_j)) \otimes_A (\oplus_{k=i}^n (\cap_{j \neq k} J_j)) \oplus (\oplus_{i=1}^n (\cap_{j \neq k} J_j)) \otimes_A (\oplus_{k=i}^{n-1} (\cap_{j \neq k} J_j)) \rightarrow \\ & (\oplus_{i=1}^n (\cap_{j \neq r} J_j)) \otimes_A (\oplus_{s=1}^n (\cap_{j \neq s} J_j)) \rightarrow I \otimes_A I \rightarrow 0. \end{aligned}$$

Let us consider the diagram

$$\begin{array}{ccccc} & & (\oplus_{k=i}^{n-1} (\cap_{j \neq k} J_j)) \otimes_A (\oplus_{k=i}^n (\cap_{j \neq k} J_j)) & \xrightarrow{\gamma} & \oplus_{k=i}^n (\cap_{j \neq k} J_j) \otimes_A (\cap_{i \neq k} J_i) \\ & & \oplus_{k=i}^n (\cap_{j \neq k} J_j) \otimes_A (\oplus_{k=i}^{n-1} (\cap_{j \neq k} J_j)) & & \oplus (\cap_{i \neq k} J_i) \otimes_A (\cap_{i \neq k} J_i) \\ & & \downarrow & & \downarrow \\ \oplus_{r \neq s} ((\cap_{i \neq r} J_i) \otimes_A (\cap_{i \neq s} J_i)) & \xrightarrow{\gamma} & (\oplus_{r=1}^n (\cap_{i \neq r} J_i)) \otimes_A (\oplus_{s=1}^n (\cap_{i \neq s} J_i)) & \xrightarrow{\beta} & \oplus_{k=1}^n (\cap_{i \neq k} J_i) \otimes_A (\cap_{i \neq k} J_i) \\ \oplus_A (\cap_{i \neq s} J_i) & & \downarrow & & \downarrow \\ \text{Ker } \beta & \xrightarrow{\quad} & I \otimes_A I & \xrightarrow{\beta} & \oplus_{k=1}^n (I/J_k) \otimes_A (I/J_k) \end{array}$$

where the first and second columns are the sequences (5) and (3) respectively,  $\beta$  is the canonical homomorphism and  $\gamma$  is the adequate epimorphism making the upper square commutative. Then it follows that the induced homomorphism

$$\oplus_{r \neq s} ((\cap_{i \neq r} J_i) \otimes_A (\cap_{i \neq s} J_i)) \rightarrow \text{Ker } \beta$$

is surjective. From that we obtain the right exactness of the top row in the diagram

$$\begin{array}{ccccc} \oplus_{r \neq s} ((\cap_{i \neq r} J_i) \otimes_A (\cap_{i \neq s} J_i)) & \rightarrow & I \otimes_A I & \xrightarrow{\beta} & \oplus_{i=1}^n ((I/J_i) \otimes_A (I/J_i)) \\ \downarrow \beta & & \downarrow & & \downarrow \\ \cap_{i=1}^n J_i & \xrightarrow{\quad} & I & \xrightarrow{\quad} & \oplus_{i=1}^n (I/J_i) \end{array}$$

in which the homomorphisms are the usual ones. Now  $\text{Im } \beta$  is

$$\sum_{r \neq s} (\cap_{i \neq r} J_i) (\cap_{i \neq s} J_i) = \sum_{i=1}^n (\cap_{i \neq k} J_i) J_k.$$

On the other hand, there exist exact sequences

$$0 \rightarrow \text{Tor}_2^A(A/I, A/I) \rightarrow I \otimes_A I \rightarrow I \rightarrow \text{Tor}_1^A(A/I, A/I) \rightarrow 0$$

and

$$0 \rightarrow \text{Tor}_2^{A/J_i}(A/I, A/I) \rightarrow (I/J_i) \otimes_A (I/J_i) \rightarrow I/J_i \rightarrow \text{Tor}_1^{A/J_i}(A/I, A/I) \rightarrow 0.$$

Therefore, application of the ker-coker Lemma to the diagram yields the sequence (1).

In order to show the exactness of the sequence (2) let  $A = ZG$  be the integral group ring of  $G$ ,  $I = IG$  the augmentation ideal of  $G$  and  $J_i = I_{M_i}$  the kernel of the ring homomorphism  $ZG \rightarrow Z(G/M_i)$ . It is clear that

$$I_{M_k} + \langle \bigcap_{i \neq k} I_{M_i} \rangle = IG, \quad 1 \leq k \leq n.$$

Moreover we have an isomorphism of abelian groups

$$\langle \bigcap_{i=1}^n I_{M_i} \rangle / \sum_{i=1}^n \langle \bigcap_{i \neq k} I_{M_i} \rangle I_{M_k} \cong \langle \bigcap_{i=1}^n M_i \rangle / \langle \{ \bigcap_{i \neq k} M_i, M_k \} \mid 1 \leq k \leq n \rangle$$

which is obtained as in the case  $n = 2$  (see [2]).

Therefore sequence (1) yields sequence (2).
