Cédrick Galusinski

A singular perturbation problem in a system of nonlinear Schrödinger equation occurring in Langmuir turbulence

<http://www.numdam.org/item?id=M2AN_2000__34_1_109_0>
A SINGULAR PERTURBATION PROBLEM IN A SYSTEM OF NONLINEAR SCHRÖDINGER EQUATION OCCURRING IN LANGMUIR TURBULENCE

CÉDRIC GALUSINSKI

Abstract. The aim of this work is to establish, from a mathematical point of view, the limit \( \alpha \to +\infty \) in the system

\[
 i\partial_t E + \nabla(\nabla \cdot E) - \alpha^2 \nabla \times \nabla \times E = -|E|^2 \sigma E,
\]

where \( E : \mathbb{R}^3 \to \mathbb{C}^3 \). This corresponds to an approximation which is made in the context of Langmuir turbulence in plasma Physics. The \( L^2 \)-subcritical \( \sigma \) (that is \( \sigma \leq 2/3 \)) and the \( H^1 \)-subcritical \( \sigma \) (that is \( \sigma \leq 2 \)) are studied. In the physical case \( \sigma = 1 \), the limit is then studied for the \( L^1(\mathbb{R}^3) \) norm.

Received: November 12, 1998. Revised: July 23, 1999.

1. SETTING OF THE PROBLEM AND MAIN RESULTS

We are interested in the first Schrödinger system that describes the coupled motion of intermingled electrons and ion fluids that compose the plasma without any magnetic field. The system satisfied by the electric field envelope \( \overline{E} \) is

\[
 -2i\omega_{pe}\partial_t \overline{E} - 3v_{Te}^2 \nabla(\nabla \cdot \overline{E}) + c^2 \nabla \times \nabla \times \overline{E} + \omega_{pe}^2 \frac{\delta n}{n_0} \overline{E} = 0,
\]

where \( \omega_{pe} \) is the electron plasma frequency, \( v_{Te} \) the average thermal velocity of the electrons, \( c \) the velocity of light, \( n_0 \) the mean density of electrons and \( \delta n \) is the low frequency variation of electron density. A justification for the time-envelope approximation can be found in [1].

Writing \( \delta n/n_0 \) in terms of \( \overline{E} \) in (1.1), we obtain

\[
 i\omega_{pe}\partial_t \overline{E} + \frac{3}{2} v_{Te}^2 \nabla(\nabla \cdot \overline{E}) - \frac{c^2}{2} \nabla \times \nabla \times \overline{E} + \frac{\varepsilon_0 \omega_{pe}^2}{8n_0 k_BT_e} |\overline{E}|^2 \overline{E} = 0,
\]

where \( \varepsilon_0 \) is the dielectric permittivity of free space, \( k_B \) the Boltzmann’s constant, and \( k_BT_e \) is the electron thermal energy.

The term $\frac{c^2}{2} \nabla \times \nabla \times \mathcal{E}$ is usually neglected in physics, the equation (1.2) becomes (see [3], p. 138),

$$\begin{align*}
\text{i} \omega p_0 \partial_t \mathcal{E} + \frac{3}{2} v_{pe}^2 \nabla \cdot (\nabla \mathcal{E}) + \frac{e_0 \omega^2 p_0^2}{8 \pi \hbar^2} |\mathcal{E}|^2 \mathcal{E} &= 0.
\end{align*}$$

(1.3)

Equations that have the general form of (1.3) widely occur in physics and are generically known as the nonlinear Schrödinger equation. The reader can refer to [3] for more details on the physical problem.

The goal of this paper is to verify, from a mathematical point of view, if the term $\frac{c^2}{2} \nabla \times \nabla \times \mathcal{E}$ can be simply neglected in (1.2) or not. Since $v_{pe}^2 \ll c^2$, the following model is considered

$$\begin{align*}
\text{i} E_t + \nabla \nabla . \mathcal{E} - \alpha^2 \nabla \times \nabla \times \mathcal{E} &= \varepsilon |\mathcal{E}|^{2\sigma} \mathcal{E},
E_{|t=0} = \mathcal{E}_0,
\end{align*}$$

(1.4)

with $\alpha > 1$ and we investigate the case $\alpha \to \infty$.

The parameter $\varepsilon$ takes the value 1 or $-1$. The complex variable $\mathcal{E}$ depends on $t \in \mathbb{R}$ and $x \in \mathbb{R}^3$.

Rather than studying this problem for $x \in \mathbb{R}^3$, we generalize this work to the case $x \in \mathbb{R}^N$ for $N \geq 2$. We then replace (1.4) by

$$\begin{align*}
\text{i} E_{\alpha t} + \nabla \nabla . \mathcal{E}_{\alpha} + \alpha^2 (\Delta - \nabla \nabla .) \mathcal{E}_{\alpha} &= \varepsilon |\mathcal{E}_{\alpha}|^{2\sigma} \mathcal{E}_{\alpha} \quad \text{in } \mathcal{D}'(\mathbb{R}^N),
E_{\alpha|t=0} = \mathcal{E}_{\alpha0}.
\end{align*}$$

(1.5)

The following splitting will be useful in the sequel,

$$\begin{align*}
\text{i} E_{\parallel t} + \Delta E_{\parallel} &= \varepsilon \mathcal{P}_{\parallel} \left( |E_{\parallel}| + |E_{\perp}| \right)^{2\sigma} (E_{\parallel} + E_{\perp}) \quad \text{in } \mathcal{D}'(\mathbb{R}^N),
E_{\parallel|t=0} = \mathcal{P}_{\parallel} \mathcal{E}_{0} \in L^2(\mathbb{R}^N),
\end{align*}$$

(1.6)

$$\begin{align*}
\text{i} E_{\perp t} + \alpha^2 \Delta E_{\perp} &= \varepsilon \mathcal{P}_{\perp} \left( |E_{\parallel}| + |E_{\perp}| \right)^{2\sigma} (E_{\parallel} + E_{\perp}) \quad \text{in } \mathcal{D}'(\mathbb{R}^N),
E_{\perp|t=0} = \mathcal{P}_{\perp} \mathcal{E}_{0} \in L^2(\mathbb{R}^N),
\end{align*}$$

(1.7)

where $\mathcal{P}_{\perp}$ denotes the Hodge projection from $L^2(\mathbb{R}^N)$ to the subspace of divergence free vector fields, $\mathcal{P}_{\parallel} = I - \mathcal{P}_{\perp}$, $E_{\parallel} = \mathcal{P}_{\parallel} \mathcal{E}_{\alpha}$ and $E_{\perp} = \mathcal{P}_{\perp} \mathcal{E}_{\alpha}$.

The results about existence and uniqueness of a solution for (1.5) are similar to the ones concerning nonlinear Schrödinger equations [2, 4, 5]. The first step is the study of the linear problem in order to obtain uniform (with respect to $\alpha$) estimates on $E_{\parallel}$ and $E_{\perp}$, defined in (1.6), (1.7). The term $E_{\perp}$ being small in some sense for large value of $\alpha$, the limit of the solution of (1.5) can be evaluated.

The limit obtained here reads:

$$\begin{align*}
\text{i} E_t + \Delta E &= \varepsilon \mathcal{P}_{\parallel} (|E|^{2\sigma} E)
E_{|t=0} = \mathcal{E}_{0\parallel}
\end{align*}$$

(1.8)

and $E = \mathcal{P}_{\parallel} \mathcal{E}$. Remark that here, $\Delta E = \nabla \nabla . \mathcal{E}$.

Remark also that the equation (1.8) is quite different of (1.3) which corresponds to

$$\begin{align*}
\text{i} E_t + \nabla \nabla . \mathcal{E} &= \varepsilon |\mathcal{E}|^{2\sigma} \mathcal{E}.
\end{align*}$$

In what follows, we establish the convergence of solutions of (1.5) to the ones of (1.8) for adequate norms.

Let us recall from [2] some results on (1.8).
Theorem 1.1. Let \( E_0 \in L^2(\mathbb{R}^N) \) and \( \sigma < \frac{2}{N} \); there exists a unique solution \( E \in C(\mathbb{R}^+; L^2(\mathbb{R}^N)) \cap L^q_{\text{loc}}([0, \infty[; \mathcal{L}^{2\sigma + 2}(\mathbb{R}^N)) \) to (1.8), where \( \frac{2}{q} = \frac{N}{2} - \frac{N}{2\sigma + 2} \).

Let \( E_0 \in H^1(\mathbb{R}^N) \) and \( \sigma < \frac{N}{2} \); there exist \( T^* > 0 \) and a unique maximal solution \( E \in C(\mathbb{R}^+; H^1(\mathbb{R}^N)) \).

There exist some initial data \( E_0 \in H^1(\mathbb{R}^N) \) (when \( \varepsilon = -1 \) and \( \sigma > \frac{2}{N} \)) for which \( T^* \) is finite.

The main results consist of the next Theorems whose proofs are developed in Section 4.

Theorem 1.2. Assume \( \sigma < \frac{N}{2} \). Let \( E_0 \in L^2(\mathbb{R}^N) \), there exists a unique global solution \( E_\alpha \in C(\mathbb{R}^+; L^2(\mathbb{R}^N)) \cap L^q_{\text{loc}}([0, \infty[; \mathcal{L}^{2\sigma + 2}(\mathbb{R}^N)) \) (where \( \frac{2}{q} = \frac{N}{2} - \frac{N}{2\sigma + 2} \)) to (1.5).

Moreover,

\[
E_\alpha(t) = e^{-i\xi^2 \Delta t}E_0, \\
E_\alpha(t) \rightarrow E \text{ in } L^q([0,T];L^2(\mathbb{R}^N)) \forall T < +\infty,
\]

where \( E \) is the solution to (1.8) introduced in Theorem 1.1.

Theorem 1.3. Assume \( \sigma < \frac{N}{2} \). Let \( E_0 \in H^1(\mathbb{R}^N) \). Then there exist \( T_\alpha > 0 \) and a unique maximal solution \( E_\alpha \in C([0,T_\alpha[; H^1(\mathbb{R}^N)) \) to (1.5). Moreover \( \liminf_{\alpha \to +\infty} T_\alpha \geq T^* \) where \( T^* \) is the existence time of the solution \( E \) to (1.8) introduced in theorem 1.1 (if \( \varepsilon = 1 \) or if \( \varepsilon = -1 \) and \( \sigma < \frac{2}{N} \) then \( T_\alpha = T^* = +\infty \)). If \( \mathcal{P}_E E_0 \rightarrow 0 \) in \( H^1(\mathbb{R}^N) \) when \( \alpha \) goes to infinity, then,

\[
E_\alpha(t) \rightarrow E \text{ in } W^{1,q}([0,T];L^2(\mathbb{R}^N)) \text{ strongly, } \frac{2}{q} = \frac{N}{2} - \frac{N}{2\sigma + 2},
\]

Remark on notation. Throughout this article, the same letter \( C \) (or sometimes \( c \)) shall denote constants which may change from line to line.

The classical space \( L^p(\mathbb{R}^N) \) is sometimes noted \( L^p \) for conciseness. Some notations will be introduced in the Preliminaries.

2. Preliminaries

2.1. The linear group

In this section, we study the following linear groups, \( S_{\parallel}(t) \) associated to

\[
iE_{\parallel} + \nabla \nabla E_{\parallel} = 0, \\
E_{\parallel|t=0} = E_0 \in L^2(\mathbb{R}^N),
\]

and \( S_{\perp}(t) \) associated to

\[
iE_{\perp} + \alpha^2(\Delta - \nabla \nabla E_{\perp} = 0, \\
E_{\perp|t=0} = E_{0\perp} \in L^2(\mathbb{R}^N).
\]

Simple computations with Fourier transform lead to

\[
\hat{E}_{\parallel}(t) = e^{-i|x|^2 t}\mathcal{M}E_{0\parallel}, \\
\hat{E}_{\perp}(t) = e^{-i\alpha^2|x|^2 t}\mathcal{M}E_{0\perp},
\]
where $M$ and $L$ denote the following matrices (in the three dimensional case),

$$
M = \frac{1}{|\xi|^2} \begin{pmatrix}
\xi_1 \xi_2 & \xi_2 \xi_3 & \xi_3 \\
\xi_1 \xi_3 & \xi_2 \xi_3 & \xi_3 \\
\xi_1 \xi_3 & \xi_2 \xi_3 & \xi_3
\end{pmatrix},
L = \frac{1}{|\xi|^2} \begin{pmatrix}
\xi_1^2 + \xi_3^2 & -\xi_1 \xi_2 & -\xi_1 \xi_3 \\
-\xi_1 \xi_2 & \xi_2^2 + \xi_3^2 & -\xi_2 \xi_3 \\
-\xi_1 \xi_3 & -\xi_2 \xi_3 & \xi_3^2 + \xi_3^2
\end{pmatrix} = I - M.
$$

**Remark 1.** For $E \in L^2(\mathbb{R}^N)$ satisfying $\nabla E = 0$ then $M \widehat{E} = 0$ and $L \widehat{E} = \widehat{E}$. That is

$$
\mathcal{F}^{-1}(M \widehat{E}) = \mathcal{P}_\parallel E, \quad \mathcal{F}^{-1}(L \widehat{E}) = \mathcal{P}_\perp E.
$$

So, we have

$$
S_\parallel(t)E_0\parallel = \mathcal{F}^{-1}(M) \ast \mathcal{F}^{-1}(e^{-i|\xi|^2t}) \ast (E_0\parallel) = \mathcal{F}^{-1}(e^{-i|\xi|^2t}) \ast (E_0\parallel),
$$

$$
S_\perp(t)E_0\perp = \mathcal{F}^{-1}(L) \ast \mathcal{F}^{-1}(e^{-i\alpha^2|\xi|^2t}) \ast (E_0\perp) = \mathcal{F}^{-1}(e^{-i\alpha^2|\xi|^2t}) \ast (E_0\perp).
$$

We then remark that the group $S_\parallel(t)$ is associated to

$$
iE_\parallel t + \Delta E_\parallel = 0,
E_\parallel |_{t=0} = E_0\parallel \in L^2(\mathbb{R}^N),
$$

and $S_\perp(t)$ is associated to

$$
iE_\perp t + \alpha^2 \Delta E_\perp = 0,
E_\perp |_{t=0} = E_0\perp \in L^2(\mathbb{R}^N).
$$

We return to the expression of $S_\parallel(t)$ and $S_\perp(t)$ in the Fourier space. It is well known that

$$
\mathcal{F}^{-1}(e^{-i\alpha^2|\xi|^2t}) = \frac{1}{(4\pi^2\alpha^2t)^{\frac{N}{2}}} e^{i\frac{|\xi|^2}{4\alpha^2t}}.
$$

It then follows

$$
S_\parallel(t)E_0\parallel = \frac{1}{(4\pi^2\alpha^2t)^{\frac{N}{2}}} \int_{\mathbb{R}^N} e^{i\frac{|\xi-y|^2}{4\alpha^2t}} E_0\parallel(y) dy,
$$

$$
S_\perp(t)E_0\perp = \frac{1}{(4\pi^2\alpha^2t)^{\frac{N}{2}}} \int_{\mathbb{R}^N} e^{i\frac{|\xi-y|^2}{4\alpha^2t}} E_0\perp(y) dy.
$$

From these last expressions and as the $S_\parallel(t)$ and $S_\perp(t)$ are unitary groups on $L^2(\mathbb{R}^N)$, we have

$$
|S_\parallel(t)E_0\parallel|_{L^2(\mathbb{R}^N)} = |E_0\parallel|_{L^2(\mathbb{R}^N)}, \quad |S_\parallel(t)E_0\parallel|_{L^\infty(\mathbb{R}^N)} \leq \frac{C}{(4\pi t)^{\frac{N}{2}}} |E_0\parallel|_{L^1(\mathbb{R}^N)}
$$

and

$$
|S_\perp(t)E_0\perp|_{L^2(\mathbb{R}^N)} = |E_0\perp|_{L^2(\mathbb{R}^N)}, \quad |S_\perp(t)E_0\perp|_{L^\infty(\mathbb{R}^N)} \leq \frac{C}{(4\pi \alpha^2 t)^{\frac{N}{2}}} |E_0\perp|_{L^1(\mathbb{R}^N)}.
$$

By interpolation, we get for $p > 2$,

$$
|S_\parallel(t)E_0\parallel|_{L^p(\mathbb{R}^N)} \leq \frac{C}{(4\pi t)^{N\left(\frac{1}{2} - \frac{1}{p}\right)}} |E_0\parallel|_{L^{p'}(\mathbb{R}^N)} \quad (2.5)
$$
and

\[ |S_\perp(t)E_0\perp|_{L^p(\mathbb{R}^N)} \leq \frac{C}{(4\pi\alpha^2 t)^{N(\frac{1}{2} - \frac{1}{p})}}|E_0\perp|_{L^{p'}(\mathbb{R}^N)}, \quad (2.6) \]

with \( \frac{1}{p} + \frac{1}{p'} = 1 \). This last estimate is fundamental since the right-hand side goes to zero when \( \alpha \) goes to infinity \( (p > 2) \).

2.2. Estimates with a right-hand side

Using the same splitting as the one used for (1.5), the solution of

\[ iE_t + \nabla \nabla E + \alpha^2 (\Delta - \nabla \nabla)E = f, \]
\[ E|_{t=0} = E_0, \quad (2.7) \]

where \( f \) depends on \( t \in \mathbb{R} \) and \( x \in \mathbb{R}^3 \), can be splitted in two equations,

\[ iE_{\parallel t} + \Delta E_{\parallel} = \varepsilon P_{\parallel} f \text{ in } \mathcal{D}'(\mathbb{R}^N), \]
\[ E_{\parallel}|_{t=0} = P_{\parallel} E_0 \in L^2(\mathbb{R}^N), \quad (2.8) \]

\[ iE_{\perp t} + \alpha^2 \Delta E_{\perp} = \varepsilon P_{\perp} f \text{ in } \mathcal{D}'(\mathbb{R}^N), \]
\[ E_{\perp}|_{t=0} = P_{\perp} E_0 \in L^2(\mathbb{R}^N). \quad (2.9) \]

We then have,

\[ E_{\parallel}(t) = S_{\parallel}(t)E_0\parallel - i \int_0^t S_{\parallel}(t - s)P_{\parallel}(f(s))ds, \]
\[ E_{\perp}(t) = S_{\perp}(t)E_0\perp - i \int_0^t S_{\perp}(t - s)P_{\perp}(f(s))ds. \]

The following result will be often used in the sequel:

Lemma 2.1. (see for example [6], p. 109). The operators \( P_{\parallel} \), \( P_{\perp} \) are continuous on \( L^p(\mathbb{R}^N) \) for all \( 1 < p < \infty \).

We also introduce the

Lemma 2.2. (see [6], p. 119). We denote

\[ I_a(f) = \int_{\mathbb{R}^d} \frac{1}{|x - y|^{d-a}}f(y)dy, \]

for \( 0 < a < d \) and \( 1 < p < q < \infty \), where \( \frac{1}{q} = \frac{1}{p} - \frac{a}{d} \). Then, there exists a constant \( A_{p,q} \) such that,

\[ |I_a(f)|_{L^q(\mathbb{R}^d)} \leq A_{p,q}|f|_{L^p(\mathbb{R}^d)}. \]

Proposition 2.1. Let \((q,r)\) two real numbers such that,

\[ \frac{1}{2} < r < \frac{2N}{N - 2}, \quad \frac{2}{q} = \frac{N}{2} - \frac{n}{r} \]

and let \((q', r')\) be the conjugate exponents of \((q, r)\).
If \( f \in L^q([0,T]; L^r(\mathbb{R}^N)) \) then

\[
\int_0^t S\| (t - s) \mathcal{P} (f(s)) \| ds \in C([0,T], L^2(\mathbb{R}^N)) \cap L^q([0,T]; L^r(\mathbb{R}^N))
\]

and

\[
\int_0^t S_{\perp} (t - s) \mathcal{P} (f(s)) ds \in C([0,T], L^2(\mathbb{R}^N)) \cap L^q([0,T]; L^r(\mathbb{R}^N)).
\]

Furthermore, there exists a real constant \( C \) depending only on \( q \) and \( r \) such that,

\[
\left| \int_0^t S\| (t - s) \mathcal{P} (f(s)) \| ds \right|_{C([0,T]; L^2(\mathbb{R}^N) \cap L^q([0,T]; L^r(\mathbb{R}^N)))} \leq C |f|_{L^q([0,T]; L^r(\mathbb{R}^N))},
\]

\[
\left| \int_0^t S_{\perp} (t - s) \mathcal{P} (f(s)) ds \right|_{C([0,T]; L^2(\mathbb{R}^N) \cap L^q([0,T]; L^r(\mathbb{R}^N)))} \leq C \alpha^{N(1 - \frac{q}{r})} |f|_{L^q([0,T]; L^r(\mathbb{R}^N))}.
\]

At last, if \( E_0 \in L^2(\mathbb{R}^N) \), then

\[
|S\| (t) \mathcal{P} (E_0) |_{L^q([0,T]; L^r(\mathbb{R}^N))} \leq C |\mathcal{P} (E_0)|_{L^2(\mathbb{R}^N)}
\]

and

\[
|S_{\perp} (t) E_0 |_{L^q([0,T]; L^r(\mathbb{R}^N))} \leq C \alpha^{N(1 - \frac{q}{r})} |E_0|_{L^2(\mathbb{R}^N)}.
\]

**Proof.** According to \((2.5)\), one has

\[
\left| \int_0^t S\| (t - s) \mathcal{P} (f(s)) \| ds \right|_{L^r(\mathbb{R}^N)} \leq C \int_0^t |t - s|^{-\frac{q}{r}} |\mathcal{P} (f(s))|_{L^r(\mathbb{R}^N)} ds,
\]

since \( \frac{n}{q} = \frac{N}{2} - \frac{N}{r} \).

In the same way, from \((2.6)\), we have

\[
\left| \int_0^t S_{\perp} (t - s) \mathcal{P} (f(s)) ds \right|_{L^r(\mathbb{R}^N)} \leq C \alpha^{-N(1 - \frac{q}{r})} \int_0^t |t - s|^{-\frac{q}{r}} |\mathcal{P} (f(s))|_{L^r(\mathbb{R}^N)} ds.
\]

It follows from Lemma 2.2 the first estimate of the proposition 2.1, (with \( d = 1, \frac{n}{q} = 1 - a \) then \( \frac{1}{q} = \frac{1}{q'} - a \), so \( p = q' \)),

\[
\left| \int_0^t S\| (t - s) \mathcal{P} (f(s)) \| ds \right|_{L^q([0,T]; L^r(\mathbb{R}^N))} \leq C |\mathcal{P} (f)|_{L^{q'}([0,T]; L^{r'}(\mathbb{R}^N))}.
\]

We now compute

\[
\left| \int_0^t S\| (t - s) \mathcal{P} (f(s)) \| ds \right|_{L^2(\mathbb{R}^N)}^2 = \int_0^t \int_0^t \langle S\| (t - s) \mathcal{P} (f(s)), S\| (t - s') \mathcal{P} (f(s')) \rangle ds ds'
\]

\[
= \int_0^t \langle \mathcal{P} (f(s)), \int_0^t S\| (s - s') \mathcal{P} (f(s')) ds' \rangle ds,
\]

where the brackets \( \langle ., . \rangle \) denotes the classical inner product on \( L^2(\mathbb{R}^N) \). We can show as previously that

\[
\left| \int_0^t S\| (s - s') \mathcal{P} (f(s')) ds \right|_{L^q([0,T]; L^r(\mathbb{R}^N))} \leq C |\mathcal{P} (f)|_{L^{q'}([0,T]; L^{r'}(\mathbb{R}^N))}.
\]
then,

\[
\left| \int_0^t S\| (t - s) P\| (f(s)) ds \right|^2_{L^2(\mathbb{R}^N)} \leq C|f|^2_{L^{\infty}([0,T];L^r(\mathbb{R}^N))}.
\]

To show the estimate

\[ |S\| (t) E_0||_{L^\infty([0,T];L^r(\mathbb{R}^N))} \leq C|E_0||_{L^2(\mathbb{R}^N)}, \]

we proceed by duality,

\[
\left| \int_0^T S\| (-t) P\| (f(t)) dt \right|^2_{L^2(\mathbb{R}^N)} = \int_0^T \int_0^T \langle P\| f(t), S\| (t - t') P\| f(t') \rangle dt dt' \leq C|f|^2_{L^{\infty}([0,T];L^r(\mathbb{R}^N))}.
\]

Then,

\[
\left| \int_0^T \langle S\| (t) (P\| E_0), P\| f(t) \rangle dt \right| = \left| \langle E_0||, \int_0^T S\| (-t) P\| f(t) dt \right| \leq |P\| E_0||_{L^2(\mathbb{R}^N)} \int_0^T S\| (-t) P\| f(t) dt \right|^2_{L^2(\mathbb{R}^N)} \leq C|P\| E_0||_{L^2(\mathbb{R}^N)} |P\| f||_{L^{\infty}([0,T];L^r(\mathbb{R}^N))}.
\]

We then have proved,

\[ |S\| (t) (E_0)||_{L^\infty([0,T];L^r(\mathbb{R}^N))} \leq C|E_0||_{L^2(\mathbb{R}^N)}. \]

Due to the similarities between (2.11) and (2.10), the same estimates for the group \( S_\perp (t) \) can be obtained by replacing \( C \) with \( Ca^{-N(1-\frac{3}{2})} \). In the same way, \( P\| \) is replaced with \( P\perp \).

We then have proved the estimates involving \( S_\perp (t) \) of Proposition 2.1. \( \square \)

3. THE CAUCHY PROBLEM

Let us recall the problem under studies,

\[
i E_t + \nabla \cdot E + \alpha^2 (\Delta - \nabla \cdot) E = \varepsilon |E|^{2\sigma} E \text{ in } D'(\mathbb{R}^N),
\]

\[
E|_{t=0} = E_0 \in L^2(\mathbb{R}^N). \tag{3.1}
\]

This system is splitted as follows,

\[
i E\|_t + \Delta E\| = \varepsilon P\| \left( |E\| + E\perp \right)^{2\sigma} (E\| + E\perp) \text{ in } D'(\mathbb{R}^N),
\]

\[
E\|_{t=0} = P\| E_0 \in L^2(\mathbb{R}^N), \tag{3.2}
\]

and

\[
i E\perp_t + \alpha^2 \Delta E\perp = \varepsilon P\perp \left( |E\| + E\perp \right)^{2\sigma} (E\| + E\perp) \text{ in } D'(\mathbb{R}^N),
\]

\[
E\perp_{t=0} = P\perp E_0 \in L^2(\mathbb{R}^N). \tag{3.3}
\]
3.1. Global existence in $L^2(\mathbb{R}^N)$

**Theorem 3.1.** Assume that $a < \frac{2}{N}$ and $E_0 \in L^2(\mathbb{R}^N)$; then there exists a unique solution $E$ of (3.1) in $C(\mathbb{R}^+; L^2(\mathbb{R}^N)) \cap L^q_{\text{loc}}(\mathbb{R}^+; L^{2a+2}(\mathbb{R}^N))$, where $\frac{2}{q} = \frac{N}{2} - \frac{N}{2a+2}$.

Also, $E$ depends continuously on $E_0$ in the sense: if $E_0^n \to E_0$ in $L^2(\mathbb{R}^N)$, then $E^n$, the solution of (3.1) with the initial data $E_0^n$, converge to $E$ in $C_{\text{loc}}(\mathbb{R}^+; L^2(\mathbb{R}^N)) \cap L^q_{\text{loc}}(\mathbb{R}^+; L^{2a+2}(\mathbb{R}^N))$.

At last, $E$ verifies

$$|P_\perp E|_{L^q([0,T];L^{2a+2}\mathbb{R}^N)} \leq C\alpha^{-\frac{N\alpha}{2a+1}} |E_0\perp|_{L^2(\mathbb{R}^N)} + C(T)\alpha^{-\frac{N\alpha}{2a+1}} |E|_{L^q([0,T];L^{2a+2}\mathbb{R}^N)}^{2\alpha+1}. \tag{3.4}$$

**Proof.** We first establish the local existence of a solution by a fixed point theorem.

Let us introduce the space

$$X(T) = L^\infty([0,T]; L^2(\mathbb{R}^N)) \cap L^q([0,T]; L^{2a+2}(\mathbb{R}^N)).$$

We note $T$ the application

$$T : X(T) \times X(T) \to X(T) \times X(T)$$

$$(E_\parallel, E_\perp) \to (T_1(E_\parallel, E_\perp), T_2(E_\parallel, E_\perp))$$

where

$$T_1(E_\parallel, E_\perp) = S_\parallel(T) E_0\parallel - i\epsilon \int_0^T S_\parallel(T-s) (P_\parallel(|E_\parallel + E_\perp|^{2\alpha}(E_\parallel + E_\perp))) ds,$$

$$T_2(E_\parallel, E_\perp) = S_\perp(T) E_0\perp - i\epsilon \int_0^T S_\perp(T-s) (P_\perp(|E_\parallel + E_\perp|^{2\alpha}(E_\parallel + E_\perp))) ds.$$
Then, there exists $\theta > 0$ such that, by virtue of Hölder inequality

$$|E_\| + E_\perp|_{L^{2}\left(\mathbb{R}^N\right)} \leq T^\theta |E_\|| + E_\perp|_{L^{2}\left(\mathbb{R}^N\right)} \leq T^\theta |E_\|| + E_\perp|_X(T).$$

Returning to (3.6), we obtain

$$|T_1(E_\|, E_\perp)|_X(T) + |T_2(E_\|, E_\perp)|_X(T) \leq C \left( |E_\||_{L^2\left(\mathbb{R}^N\right)} + |E_\perp|_{L^2\left(\mathbb{R}^N\right)} + T^{(2\sigma+1)\theta} \left( |E_\|_{X(T)}^{2\sigma+1} + |E_\perp|_{X(T)}^{2\sigma+1} \right) \right).$$

(3.7)

**Lemma 3.1.** If $T$ is small enough, then $T$ operates from the ball $B(0, R)$ of $X(T) \times X(T)$ into itself as soon as

$$R \leq 4C |E_\||_{L^2\left(\mathbb{R}^N\right)}.$$

**Proof.** With $R$ introduced in Lemma 3.1, inequality (3.7) becomes

$$|T(E_\|, E_\perp)|_{X(T) \times X(T)} \leq \frac{R}{2} + 2CT^{(2\sigma+1)\theta} |(E_\|, E_\perp)|_{X(T) \times X(T)}.$$

So, for $T$ small enough, the Lemma 3.1 is proved.

**Lemma 3.2.** If $T$ is small enough, then $T$ is a contraction on $B_R$.

**Proof.** Let $(E_\|_1, E_\perp_1)$ and $(E_\|_2, E_\perp_2)$ belonging to $X(T) \times X(T),

$$|T_1(E_\|_1, E_\perp_1) - T_1(E_\|_2, E_\perp_2)|_X(T) + |T_2(E_\|_1, E_\perp_1) - T_2(E_\|_2, E_\perp_2)|_X(T)$$

$$\leq C \left( |E_\|_1 - E_\|_2| + |E_\perp_1 - E_\perp_2| \right)_{L^{\infty}\left(\mathbb{R}^N; L^{2\sigma+2}\right)}.$$

As,

$$||u||^{2\sigma} |v - v||^{2\sigma} \leq \left( 2\sigma + 1 \right) (|u||^{2\sigma} + |v||^{2\sigma}) |u - v|,$$

we have,

$$|T_1(E_\|_1, E_\perp_1) - T_1(E_\|_2, E_\perp_2)|_X(T) + |T_2(E_\|_1, E_\perp_1) - T_2(E_\|_2, E_\perp_2)|_X(T)$$

$$\leq C \left( |E_\|_1 - E_\|_2| + |E_\perp_1 - E_\perp_2| \right)_{L^{\infty}\left(\mathbb{R}^N; L^{2\sigma+2}\right)}.$$

(3.8)

From Hölder inequality, we obtain,

$$|T_1(E_\|_1, E_\perp_1) - T_1(E_\|_2, E_\perp_2)|_X(T) + |T_2(E_\|_1, E_\perp_1) - T_2(E_\|_2, E_\perp_2)|_X(T)$$

$$\leq C \left( |E_\|_1^{2\sigma} + |E_\|_2^{2\sigma} \right)_{L^1\left(\mathbb{R}^N; L^{\gamma}\right)} \left( |E_\|_1^{2\sigma} + |E_\|_2^{2\sigma} \right)_{L^2\left(\mathbb{R}^N; L^{\gamma}\right)}.$$

with

$$\frac{1}{\gamma} + \frac{1}{\beta} = \frac{1}{\gamma_1} + \frac{1}{\gamma_2} = \frac{q}{q_1} = \frac{q}{q_2} = \frac{q}{2\sigma}.$$

We choose $\gamma = \frac{2\sigma+2}{2\sigma}$ then $\beta = 2\sigma + 2$ and we take $q_1 = \frac{q}{2\sigma}$.

Then, as $\sigma < \frac{q}{2\gamma}$, we can verify that

$$q_2 = \frac{q}{q - 2\sigma} < q.$$

Then, there exists $\theta > 0$ such that

$$|T_1(E_\|_1, E_\perp_1) - T_1(E_\|_2, E_\perp_2)|_X(T) + |T_2(E_\|_1, E_\perp_1) - T_2(E_\|_2, E_\perp_2)|_X(T)$$

$$\leq CT^\theta \left( |E_\|_1 + E_\|_2|^{2\sigma} ||_X(T) + |E_\|_2 + E_\|_2|^{2\sigma} ||_X(T) \right) \left( |E_\|_1 - E_\|_2|_X(T) + |E_\perp_1 - E_\perp_2|_X(T) \right).$$

This last estimate with $T$ small enough ensures the Lemma 3.2. $\square$
The existence of a solution in $X(T)$ follows from the Banach fixed point theorem. Furthermore $T$ depends only on $|E_0|_{L^2(\mathbb{R}^N)}$ (σ fixed).

In fact $T = +\infty$ because the $L^2(\mathbb{R}^N)$-norm of $E(t) = E_\parallel(t) + E_\perp(t)$ is constant for all $t$. This is obtained, formally, by inner product of (3.1) with $\overline{E}_t$.

At this step, we know that $T_2(E_\parallel, E_\perp) = E_\perp$, then the estimates (3.5) shows (3.4). This ends the proof of Theorem 3.1. \(\square\)

3.2. Local or global existence in $H^1(\mathbb{R}^N)$

This section is devoted to the existence of solution for (3.1) in $H^1(\mathbb{R}^N)$.

**Theorem 3.2.** Assume that $\sigma < \frac{N}{2}$ and $E_0 \in H^1(\mathbb{R}^N)$; then there exist $T_\alpha > 0$ and a unique maximal solution of (3.1) in $C([0, T_\alpha]; H^1(\mathbb{R}^N)) \cap L^q_{\text{loc}}([0, T_\alpha]; W^{1,2\sigma+2}(\mathbb{R}^N))$, where $\frac{2}{q} = \frac{N}{2} - \frac{N}{2\sigma+2}$. Furthermore, if $T_\alpha < +\infty$, then

$$\lim_{t \to T_\alpha} |E(t)|_{H^1(\mathbb{R}^N)} = +\infty.$$ 

Also, $E$ depends continuously on $E_0$ in the sense: if $E_0^n \to E_0$ in $H^1(\mathbb{R}^N)$ then $E^n$, the solution of (3.1) with the initial data $E_0^n$ converge to $E$ in

$$C([0, T]; H^1(\mathbb{R}^N)) \cap L^q([0, T]; W^{1,2\sigma+2}(\mathbb{R}^N)) \forall T < T_\alpha.$$ 

At last the following estimate holds

$$|\nabla P_\perp E|_{L^q([0, T]; L^{2\sigma+2}(\mathbb{R}^N))} \leq C\alpha^{-\frac{N}{2\sigma+2}} |\nabla E_\perp|_{L^2(\mathbb{R}^N)} + C(T)\alpha^{-\frac{N}{2\sigma+2}} |E|_{Y(T)}^{2\sigma+1}, \quad (3.9)$$

with

$$Y(T) = \{ E \text{ such that } E \in X(T), \nabla E \in X(T) \}.$$ 

**Proof.** We keep the same notations as in the proof of Theorem 3.1. As before, we assume that $\alpha \geq 1$. We prove this theorem by a fixed point method on the space $Y(T) \times Y(T)$. We saw that

$$|T_1(E_\parallel, E_\perp)|_{X(T)} + |T_2(E_\parallel, E_\perp)|_{X(T)} \leq$$

$$C \left( |E_\parallel|_{L^2(\mathbb{R}^N)} + |E_\perp|_{L^2(\mathbb{R}^N)} + |E_\parallel|_{L^{2\sigma+2}(\mathbb{R}^N)} + |E_\perp|_{L^{2\sigma+2}(\mathbb{R}^N)} \right), \quad (3.10)$$

and we remark that, since $(2\sigma + 2)^{-1} = \frac{2\sigma}{2\sigma+2} + \frac{1}{2\sigma+2}$,

$$|E|_{L^{2\sigma+2}(\mathbb{R}^N)}^{2\sigma} \leq |E|_{L^{2\sigma+2}(\mathbb{R}^N)}^{2\sigma} |E|_{L^{2\sigma+2}(\mathbb{R}^N)}.$$ 

As $H^1(\mathbb{R}^N)$ imbeds in $L^{2\sigma+2}(\mathbb{R}^N)$, as soon as $\sigma < \frac{2}{N-2}$, we have

$$|T_1(E_\parallel, E_\perp)|_{X(T)} + |T_2(E_\parallel, E_\perp)|_{X(T)} \leq$$

$$C \left( |E_\parallel|_{L^2(\mathbb{R}^N)} + |E_\perp|_{L^2(\mathbb{R}^N)} + |E_\parallel|_{L^{\infty}(\mathbb{R}^N)} + |E_\parallel|_{L^\infty(\mathbb{R}^N)} |E_\parallel|_{L^{2\sigma+2}(\mathbb{R}^N)} \right).$$

Then, from Hölder’s inequality, we obtain,

$$|T_1(E_\parallel, E_\perp)|_{X(T)} + |T_2(E_\parallel, E_\perp)|_{X(T)} \leq$$

$$C \left( |E_\parallel|_{L^2(\mathbb{R}^N)} + |E_\perp|_{L^2(\mathbb{R}^N)} + |E_\parallel|_{L^{\infty}(\mathbb{R}^N)} |E_\parallel|_{L^{2\sigma+2}(\mathbb{R}^N)} T^{\frac{1}{2\sigma+2}} |E_\parallel|_{X(T)} \right). \quad (3.11)$$
As,
\[
\|\nabla (|E_\| + E_\perp |E_\| + E_\perp)\| \leq (2\sigma + 1)|E_\| + E_\perp, \quad \|\nabla E_\perp + E_\perp\|,
\]
an estimate on \(\nabla T_1(E_\|, E_\perp)\) and \(\nabla T_2(E_\|, E_\perp)\) with \(X(T)\)-norm leads, in the same way as (3.11), to
\[
\|\nabla T_1(E_\|, E_\perp)|X(T) + \nabla T_2(E_\|, E_\perp)|X(T)
\leq C \left(\|\nabla E_0\|_{L^2(\mathbb{R}^N)} + \|\nabla E_0\|_{L^2(\mathbb{R}^N)} + |E_\perp\|_{L^\infty([0,T];H^1(\mathbb{R}^N))}T^{\frac{1}{\sigma} - \frac{1}{2}}\|\nabla E\|_{X(T)} \right). \quad (3.12)
\]
Estimates (3.11) and (3.12) establish the

**Lemma 3.3.** Let \(R' = 4C(|E_0\|_{H_0^1(\mathbb{R}^N)} + |E_0\|_{H_1(\mathbb{R}^N)})\), if \(T\) is small enough, the application \(T\) operates from the ball \(B(0, R')\) of \((Y(T) \times Y(T))\) into itself.

**Lemma 3.4.** If \(T\) is small enough, \(T\) is a contraction on \(B_R'(Y(T) \times Y(T))\).

**Proof.** Let \((E_\|_1, E_\perp_1)\) and \((E_\|_2, E_\perp_2)\) belonging to \((Y(T) \times Y(T))\). Starting from (3.8) and using the same idea as for the proof of Lemma 3.3, we have
\[
|T_1(E_\|_1, E_\perp_1) - T_1(E_\|_2, E_\perp_2)|X(T) + |T_2(E_\|_1, E_\perp_1) - T_2(E_\|_2, E_\perp_2)|X(T)
\leq C \sum_{i=1}^2 |E_\|_i + E_\perp_2|_{H^\infty([0,T];H^1(\mathbb{R}^N))}T^{\frac{1}{\sigma} - \frac{1}{2}}(|E_\|_1 - E_\|_2|X(T) + |E_\perp_1 - E_\perp_2|X(T)).
\]

At this step, we have shown that, for \(T\) small enough, \(T\) is a contraction on \(B_R'(Y(T) \times Y(T))\) for the \(X(T) \times X(T)\) topology. The Theorem 3.2 is thus proved by fixed point method on \((Y(T) \times Y(T))\). In fact, we can estimate \(T_1(E_\|_1, E_\perp_1) - T_1(E_\|_2, E_\perp_2)\) with the \(Y(T) \times Y(T)\)-norm,
\[
|\nabla (T_1(E_\|_1, E_\perp_1) - T_1(E_\|_2, E_\perp_2))|X(T) + |\nabla (T_2(E_\|_1, E_\perp_1) - T_2(E_\|_2, E_\perp_2))|X(T)
\leq C\|\nabla f(E_\|_1 + E_\perp_1) - \nabla f(E_\|_2 + E_\perp_2)|_{L^\infty([0,T];L^{2\sigma+2})} \quad (3.13)
\]
with \(f(u) = |u|^{2\sigma}u\).

Remark that
\[
|f'(u)| \leq (2\sigma + 1)|u|^{2\sigma},
|f''(u)| \leq 2\sigma(2\sigma + 1)|u|^{2\sigma-1}. \quad (3.14)
\]
Let us write \(u = E_\|_1 + E_\perp_1\) and \(v = E_\|_2 + E_\perp_2\),
\[
\nabla f(u) - \nabla f(v) = f'(u)\nabla u + f'(v)\nabla v = f'(u)(\nabla u - \nabla v)(f'(u) - f'(v))\nabla v
= f'(u)(\nabla u - \nabla v) + \int_0^1 f''(u + \theta(v - u))(v - u)d\theta\nabla v.
\]
So, since \(\frac{2\sigma}{2\sigma + 2} + \frac{1}{2\sigma + 2} = \frac{1}{(2\sigma + 2)^3}\) and \(\frac{2\sigma - 1}{2\sigma + 2} + \frac{1}{2\sigma + 2} = \frac{1}{(2\sigma + 2)^3}\),
\[
|\nabla f(u) - \nabla f(v)|_{L^\infty([0,T];L^{2\sigma+2})} \leq C|f'(u)|_{L^\infty([0,T];L^{2\sigma+2})} |\nabla f(u) - \nabla f(v)|_{L^\infty([0,T];L^{2\sigma+2})} + C \sup_{\theta \in (0,1)} |f''(u + \theta(v - u))|_{L^\infty([0,T];L^{2\sigma+2})} |v - u|_{L^\infty([0,T];L^{2\sigma+2})} |\nabla f|_{L^\infty([0,T];L^{2\sigma+2})}.
\]
Using this result in (3.13), we obtain, by virtue of (3.14),
\[
|\nabla T_1(E_{||1}, E_{\perp 1}) - \nabla T_1(E_{||2}, E_{\perp 2})|_{X(T)} + |\nabla T_2(E_{||1}, E_{\perp 1}) - \nabla T_2(E_{||2}, E_{\perp 2})|_{X(T)} \\
\leq C |E_{||1} + E_{\perp 1}|_{L^\infty([0,T],[L^{2\sigma+2}(\mathbb{R}^N)])}^{2\sigma} |\nabla(E_{||1} - E_{||2}) + \nabla(E_{\perp 1} - E_{\perp 2})|_{L^\infty([0,T],[L^{2\sigma+2}(\mathbb{R}^N)])} \\
+ C \sum_{i=1}^{2} |E_{||i} + E_{\perp i}|_{L^\infty([0,T],[L^{2\sigma+2}(\mathbb{R}^N)])}^{2\sigma-1} |\nabla(E_{||2} + E_{\perp 2})|_{L^\infty([0,T],[L^{2\sigma+2}(\mathbb{R}^N)])} \\
\times (|E_{||1} - E_{||2}|_{L^\infty([0,T],[L^{2\sigma+2}(\mathbb{R}^N)])} + |E_{\perp 1} - E_{\perp 2}|_{L^\infty([0,T],[L^{2\sigma+2}(\mathbb{R}^N)])}).
\]

As $H^1(\mathbb{R}^N)$ imbeds in $L^{2\sigma+2}(\mathbb{R}^N)$, and from Hölder inequality, we obtain
\[
|\nabla T_1(E_{||1}, E_{\perp 1}) - \nabla T_1(E_{||2}, E_{\perp 2})|_{X(T)} + |\nabla T_2(E_{||1}, E_{\perp 1}) - \nabla T_2(E_{||2}, E_{\perp 2})|_{X(T)} \\
\leq C \left( |E_{||1} + E_{\perp 1}|_{L^\infty([0,T],[H^1])}^{2\sigma} + \sum_{i=1}^{2} |E_{||i} + E_{\perp i}|_{L^\infty([0,T],[H^1])}^{2\sigma-1} |\nabla(E_{||2} + E_{\perp 2})|_{L^\infty([0,T],[L^{2\sigma+2}])} \right) \\
\times T^{\frac{2\sigma-1}{4}} \left( |E_{||1} - E_{||2}|_{Y(T)} + |E_{\perp 1} - E_{\perp 2}|_{Y(T)} \right).
\]

This ensures that, for $T$ small enough, $T$ is a contraction on $B_{R^2}(Y(T) \times Y(T))$ for the $Y(T) \times Y(T)$ topology. Then, the Banach fixed point theorem shows that $E$ depends continuously on the initial data $E_0$ for the $Y(T)$ topology.

The estimate (3.9) follows from Proposition 2.1, as the estimate (3.12). The Theorem 3.2 is then proved.

**Theorem 3.3.**
- If $\varepsilon = 1$ and $\sigma < \frac{2}{N-2}$ then the solution of (3.1) with $E_0 \in H^1(\mathbb{R}^N)$ belongs to $C([0,\infty];H^1(\mathbb{R}^N)) \cap L^q_{\text{loc}}([0,\infty];W^{1,2\sigma+2}(\mathbb{R}^N))$, where $\frac{2}{q} = \frac{2}{2} - \frac{N}{2\sigma+2}$.
- If $\varepsilon = -1$ and $\sigma < \frac{2}{N}$, then the solution of (3.1) with $E_0 \in H^1(\mathbb{R}^N)$ belongs to $C([0,\infty];H^1(\mathbb{R}^N)) \cap L^q_{\text{loc}}([0,\infty];W^{1,2\sigma+2}(\mathbb{R}^N))$, where $\frac{2}{q} = \frac{N}{2} - \frac{N}{2\sigma+2}$.

**Proof.** These results follows from the energy conservation,
\[
|\nabla E_{||}(t)|_{L^2(\mathbb{R}^N)}^2 + \alpha^2 |\nabla E_{\perp}(t)|_{L^2(\mathbb{R}^N)}^2 + \frac{\varepsilon}{2} |E_{||}(t) + E_{\perp}(t)|_{L^{2\sigma+2}(\mathbb{R}^N)}^{2\sigma+2} = \\
|\nabla E_0|_{L^2(\mathbb{R}^N)}^2 + \alpha^2 |\nabla E_0|_{L^2(\mathbb{R}^N)}^2 + \frac{\varepsilon}{2} |E_0 + E_0|_{L^{2\sigma+2}(\mathbb{R}^N)}^{2\sigma+2}.
\] (3.15)

This last is obtained, formally, by taking the real part of the inner product of (3.2) with $\overline{E_{||}}$,
\[
-\frac{d}{dt} |\nabla E_{||}|_{L^2(\mathbb{R}^N)}^2 = \varepsilon \int_{\mathbb{R}^N} \mathcal{P}_{||}(\overline{|E|^{2\sigma} E}) \overline{E_{||}} - \varepsilon \int_{\mathbb{R}^N} |E|^{2\sigma} \overline{E}_{||},
\]
by taking the real part of the inner product of (3.3) with $\overline{E_{\perp}}$,
\[
-\alpha^2 \frac{d}{dt} |\nabla E_{\perp}|_{L^2(\mathbb{R}^N)}^2 = \varepsilon \int_{\mathbb{R}^N} \mathcal{P}_{\perp}(\overline{|E|^{2\sigma} E}) \overline{E_{\perp}} - \varepsilon \int_{\mathbb{R}^N} |E|^{2\sigma} \overline{E}_{\perp}.
\]

Then, adding and integrating these two estimates, we obtain (3.15). • The first part of the theorem ($\varepsilon = 1$) is then obvious, since the solution, bounded in $H^1(\mathbb{R}^N) \subset L^{2\sigma+2}(\mathbb{R}^N)$, can not blow up.
- Assume that $\varepsilon = -1$, we have
\[
|\nabla E_{||}(t)|_{L^2(\mathbb{R}^N)}^2 + \alpha^2 |\nabla E_{\perp}(t)|_{L^2(\mathbb{R}^N)}^2 = C + \frac{1}{4\sigma + 4} |E_{||}(t) + E_{\perp}(t)|_{L^{2\sigma+2}(\mathbb{R}^N)}^{2\sigma+2}.
\] (3.16)
We recall the Gagliardo-Nirenberg inequality,

**Lemma 3.5.** Let $u$ be in $H^1(\mathbb{R}^N)$,

$$|u|_{L^{2\sigma+2}(\mathbb{R}^N)}^{2\sigma+2} \leq c|\nabla u|_{L^2(\mathbb{R}^N)}^{N} |u|_{L^2(\mathbb{R}^N)}^{2((2-N)\sigma+2)}.$$

Assume that $\sigma < \frac{2}{N}$, then, since the $L^2(\mathbb{R}^N)$-norm of $E$ is conserved,

$$|E\|_2(t) + E_{\perp}(t)|_{L^{2\sigma+2}(\mathbb{R}^N)}^{2\sigma+2} \leq c|\nabla(E\|_2(t) + E_{\perp}(t))|^\mu_\perp (E_0)|_{L^2(\mathbb{R}^N)}^{2((2-N)\sigma+2)},$$

with $\mu < 2$. Finally, if $\alpha \geq 1$, the estimate (3.16) leads to

$$|\nabla E|_{L^2(\mathbb{R}^N)}^2 = |\nabla E\|_2(t)|_{L^2(\mathbb{R}^N)}^2 \leq c' |\nabla E|_{L^2(\mathbb{R}^N)}^\mu + C(\alpha).$$

Then, assume that $E$ blows up in $H^1(\mathbb{R}^N)$, this is clearly impossible by virtue of the following inequality,

$$|\nabla E|_{L^2(\mathbb{R}^N)}^2 \leq c' + \frac{C(\alpha)}{\|\nabla E\|_{L^2(\mathbb{R}^N)}^\mu}.$$

Then, the second part of Theorem 3.3 is proved.

4. THE CONVERGENCE WHEN $\alpha$ GOES TO INFINITY

The estimates (3.4) and (3.9) are the main point to study the convergence of the solution when $\alpha$ goes to infinity.

4.1. Convergence in $L^2(\mathbb{R}^N)$

**Theorem 4.1.** Assume $\sigma < \frac{2}{N}$. Let us denote $E_\alpha$ the solution of (3.1), passing to the limit, we have

$$E_\alpha \rightarrow E \text{ in } L^2([0,T];L^{2\sigma+2}(\mathbb{R}^N)) \text{ strongly,}$$

$$E_\alpha - S_{\perp}(.)(E_0) \rightarrow E \text{ in } L^\infty([0,T];L^2(\mathbb{R}^N)) \forall T < +\infty,$$

where $E$ verifies

$$iE_t + \triangle E = P_{\|}(|E|^{2\sigma} E)$$

$$E_{t=0} = E_0.$$

**Proof.** Remark that $E$, the solution of (4.1) can be estimated as for the solution of (3.1), that is to say, $E$ belongs to $L^q([0,T];L^{2\sigma+2}(\mathbb{R}^N)) \cap L^\infty([0,T];L^2(\mathbb{R}^N))$ for all $T > 0$.

Let us modify the notations of the previous sections. The solutions of (3.1), (3.2) and (3.3) are indexed by $\alpha$ ($E_\alpha$, $E_{\alpha\|}$ and $E_{\alpha\perp}$ respectively):

$$iE_{\alpha t} + \nabla \nabla E_{\alpha} + \alpha^2 (\triangle - \nabla \nabla) E_{\alpha} = \varepsilon |E_{\alpha}|^{2\sigma} E_{\alpha} \text{ in } \mathcal{D}'(\mathbb{R}^N),$$

$$E_{\alpha|t=0} = E_0 \in L^2(\mathbb{R}^N).$$

(4.2)
This system is split as follows,

\[ \begin{align*}
    iE_\alpha + \Delta E_\alpha &= \epsilon P_\parallel (|E_\alpha| + E_\alpha E_\alpha)^{2}\sigma(E_\alpha + E_\alpha) \quad \text{in } D'(\mathbb{R}^N), \\
    E_\alpha |_{t=0} &= P_\parallel E_0 \in L^2(\mathbb{R}^N), \\
    \end{align*} \tag{4.3} \]

\[ \begin{align*}
    iE_{\alpha \perp} + \alpha^2 \Delta E_{\alpha \perp} &= \epsilon P_\perp (|E_\alpha| + E_\alpha E_\alpha)^{2}\sigma(E_\alpha + E_\alpha) \quad \text{in } D'(\mathbb{R}^N), \\
    E_{\alpha \perp} |_{t=0} &= P_\perp E_0 \in L^2(\mathbb{R}^N). \\
    \end{align*} \tag{4.4} \]

In the previous section, with (3.4), we have shown that

\[ E_\alpha \perp \to 0 \quad \text{in } L^q([0,T]; L^{2\sigma+2}(\mathbb{R}^N)). \]

Also,

\[ E_\alpha \perp - S_{\perp} E_\alpha \to 0 \quad \text{in } L^\infty([0,T]; L^2(\mathbb{R}^N)). \]

To establish the theorem, we just have to prove that

\[ E_{\alpha \parallel} \to E \quad \text{in } L^q([0,T]; L^{2\sigma+2}(\mathbb{R}^N)) \cap L^\infty([0,T]; L^2(\mathbb{R}^N)). \]

Let \( D_\alpha = E_{\alpha \parallel} - E \), \( D_\alpha \) verifies the partial differential system

\[ \begin{align*}
    iD_\alpha + \Delta D_\alpha &= \epsilon P_\parallel (|E_\alpha| + E_\alpha E_\alpha)^{2}\sigma(E_\alpha + E_\alpha) - |E|^{2\sigma}E \\
    D_\alpha |_{t=0} &= 0. \\
    \end{align*} \]

This last is equivalent to

\[ D_\alpha(t) = \int_0^t S_{\parallel}(t-s)P_\parallel (|E_\alpha| + E_\alpha E_\alpha)^{2}\sigma(E_\alpha + E_\alpha) - |E|^{2\sigma}E(s)ds. \]

Applying the proposition 2.1, we have

\[ |D_\alpha|_{L^q([0,T]; L^{2\sigma+2}) \cap L^\infty([0,T]; L^2(\mathbb{R}^N))} \leq C \left| |E_\alpha| + E_\alpha E_\alpha|^{2}\sigma(E_\alpha + E_\alpha) - |E|^{2\sigma}E \right|_{L^q([0,T]; L^{2\sigma+2})} \]

The right-hand side is estimated in the same way as in the previous section to establish the Lemma 3.2.

\[ \left| |E_\alpha| + E_\alpha E_\alpha|^{2}\sigma(E_\alpha + E_\alpha) - |E|^{2\sigma}E \right|_{L^q([0,T]; L^{2\sigma+2})} \leq \]

\[ C \left| |E_\alpha| + E_\alpha E_\alpha|^{2}\sigma \right|_{L^q([0,T]; L^{2(2\sigma+2)})} \left| |E|^{2\sigma}E \right|_{L^{q_1}([0,T]; L^{2\sigma})} \]

with \( q \cdot q_1 = \frac{q_1 q_2}{2\sigma}, \frac{1}{q_1} + \frac{1}{q_2} = \frac{1}{q_1}. \)

We choose \( \gamma = \frac{2\sigma+2}{2\sigma} \) then \( \beta = 2\sigma + 2 \) and we take \( q_1 = \frac{2}{2\sigma}. \)

Then, as \( \sigma < \frac{\gamma}{\beta} \) we can verify that

\[ q_2 = \frac{q q_1}{q_2 - 2\sigma q_1} < q. \]

Then, there exists \( \theta = \frac{1}{q_2} - \frac{1}{q} > 0 \) such that

\[ |D_\alpha|_{L^q([0,T]; L^{2\sigma+2}) \cap L^\infty([0,T]; L^2)} \leq \]

\[ CT^{\theta} \left( |E_\alpha|_{L^q([0,T]; L^{2\sigma+2})} + |E|_{L^q([0,T]; L^{2\sigma+2})} \right) \left( |D_\alpha|_{L^q([0,T]; L^{2\sigma+2})} + |E_\alpha|_{L^q([0,T]; L^{2\sigma+2})} \right). \]
That is, if \( T < T_m < \infty \),
\[
|D_\alpha|_{L^2([0,T];L^{2\sigma+2}(\mathbb{R}^N))} \leq C(T_m)T^\theta \left( |D_\alpha|_{L^2([0,T];L^{2\sigma+2}(\mathbb{R}^N))} + |E_{\alpha}\perp|_{L^2([0,T];L^{2\sigma+2}(\mathbb{R}^N))} \right).
\]
So, if we choose \( T \) small enough,
\[
|D_\alpha|_{L^2([0,T];L^{2\sigma+2}(\mathbb{R}^N))} \leq \frac{1}{2} |D_\alpha|_{L^2([0,T];L^{2\sigma+2}(\mathbb{R}^N))} + \frac{1}{2} |E_{\alpha}\perp|_{L^2([0,T];L^{2\sigma+2}(\mathbb{R}^N))}.
\]
That is,
\[
|D_\alpha|_{L^2([0,T];L^{2\sigma+2}(\mathbb{R}^N))} \leq |E_{\alpha}\perp|_{L^2([0,T];L^{2\sigma+2}(\mathbb{R}^N))}.
\]
We then have shown that \( D_\alpha \) goes to zero when \( \alpha \) goes to infinity on \( L^2([0,T];L^{2\sigma+2}(\mathbb{R}^N)) \cap L^\infty([0,T];L^2(\mathbb{R}^N)) \) if \( T \) is small enough. In fact, we have the same results for all \( T < \infty \). Assume that there exists \( T_m < \infty \) such that
\[
D_\alpha \to 0 \quad \text{in} \quad L^2([0,T];L^{2\sigma+2}(\mathbb{R}^N)) \cap L^\infty([0,T];L^2(\mathbb{R}^N)) \quad \forall T < T_m,
\]
\[
D_\alpha \to 0 \quad \text{in} \quad L^2([T_m+\eta];L^{2\sigma+2}(\mathbb{R}^N)) \cap L^\infty([T_m+\eta];L^2(\mathbb{R}^N)) \quad \forall \eta > 0.
\]
As previously, we show that there exits \( \delta > 0 \) such that
\[
|D_\alpha|_{L^2([T,T+\delta];L^{2\sigma+2}(\mathbb{R}^N))} \leq C|D_\alpha|(T) + |E_{\alpha}\perp|_{L^2([T,T+\delta];L^{2\sigma+2}(\mathbb{R}^N))}.
\]
From the first part of (4.5), we know that:
\[
D_\alpha(T) \to 0 \quad \text{in} \quad L^2(\mathbb{R}^N), \quad (T < T_m)
\]
\[
E_{\alpha}\perp \to 0 \quad \text{in} \quad L^q([T,T+\delta];L^{2\sigma+2}(\mathbb{R}^N)).
\]
Then, let us choose \( T = T_m - \frac{\delta}{2} \) and the second relation of (4.5) is false. The Theorem 4.1 is so proved. \( \Box \)

4.2. Convergence in \( H^1(\mathbb{R}^N) \)

Let us now formulate a result on convergence of solution of (4.2) when \( \alpha \) goes to infinity in \( H^1(\mathbb{R}^N) \).

**Theorem 4.2.** Assume that \( \sigma < \frac{2}{N-2} \), if \( P_\perp E_0 \to 0 \) in \( H^1(\mathbb{R}^N) \) when \( \alpha \) goes to infinity, then
\[
E_\alpha \to E \quad \text{in} \quad W^{1,q}([0,T];L^{2\sigma+2}(\mathbb{R}^N)) \quad \text{strongly} \quad \left( \frac{2}{q} = \frac{N}{2} - \frac{N}{2\sigma + 2} \right),
\]
\[
E_\alpha \to E \quad \text{in} \quad L^\infty([0,T];H^1(\mathbb{R}^N)) \quad \forall T < T^*,
\]
where \( E \) verifies (4.1) and \( T^* \) is the existence time of the solution of (4.1) in
\[
C([0,T];H^1(\mathbb{R}^N)) \cap W^{1,q}([0,T];L^{2\sigma+2}(\mathbb{R}^N)),
\]
see theorem 1.1, also \( \liminf_{\alpha \to +\infty} T_\alpha \geq T^* \).

If \( \varepsilon = 1 \) or if \( \varepsilon = -1 \) and \( \sigma < \frac{2}{N} \) then \( T^* = +\infty \).

**Proof.** Remark that \( E_\alpha \) the solution of (4.1) is well defined in \( L^\infty([0,T];H^1(\mathbb{R}^N)) \cap W^{1,q}([0,T];L^{2\sigma+2}(\mathbb{R}^N)) \), for \( T \) (eventually) small enough. This can be shown as for \( E_0 \), see [2].

In the previous section, with (3.9), we have shown that
\[
E_\alpha_{\perp} \to 0 \quad \text{in} \quad W^{1,q}([0,T];L^{2\sigma+2}(\mathbb{R}^N)) \quad \forall T < T^*.
\]
Also,
\[ E_{\alpha \perp} - S(t)E_0 \rightarrow 0 \text{ in } L^\infty([0,T]; H^1(\mathbb{R}^N)) \forall T < T^*. \]

It remains to be shown that
\[ E_{\alpha \parallel} \rightarrow E \text{ in } W^{1,q}([0,T]; L^{2\sigma+2}(\mathbb{R}^N)) \cap L^\infty([0,T]; H^1(\mathbb{R}^N)) \forall T < T^*. \]

We introduce again \( D_\alpha = E_{\alpha \parallel} - E \),
\[ D_\alpha(t) = \int_0^t S_{\parallel}(t-s)P_{\parallel}(|E_{\alpha \parallel}| + E_{\alpha \perp})^2(E_{\alpha \parallel} + E_{\alpha \perp}) - |E|^{2\sigma}E(s)ds. \]

The proposition 2.1 ensures that
\[ |D_\alpha|_{L^q([0,T]; L^{2\sigma+2}(\mathbb{R}^N)) \cap L^\infty([0,T]; L^2(\mathbb{R}^N))} \leq C \left\| |E_{\alpha \parallel}|^{2\sigma} - |E|^{2\sigma}E \right\|_{L^{q'}([0,T]; L^{2\sigma+2}(\mathbb{R}^N))}. \]

That is,
\[ |D_\alpha|_{L^q([0,T]; L^{2\sigma+2}(\mathbb{R}^N)) \cap L^\infty([0,T]; L^2(\mathbb{R}^N))} \leq C \left( |E_{\alpha \parallel}|^{2\sigma} + |E|^{2\sigma} \right)|D_\alpha|_{L^{q'}([0,T]; L^{2\sigma+2}(\mathbb{R}^N))} \leq C \left( |E_{\alpha \parallel}|^{2\sigma} + |E|^{2\sigma} \right) |E_{\alpha \parallel} - E|_{L^{q'}([0,T]; L^{2\sigma+2}(\mathbb{R}^N))}. \]

As \( H^1(\mathbb{R}^N) \subset L^{2\sigma+2}(\mathbb{R}^N) \) \((\sigma < 2\frac{2}{N-2})\), and from Hölder inequality, we have
\[ |D_\alpha|_{L^q([0,T]; L^{2\sigma+2}(\mathbb{R}^N)) \cap L^\infty([0,T]; L^2(\mathbb{R}^N))} \leq C \left( |E_{\alpha \parallel}|^{2\sigma} + |E|^{2\sigma} \right) T^{\frac{1}{2} - \frac{1}{q'}} |E_{\alpha \parallel} - E|_{L^q([0,T]; L^{2\sigma+2}(\mathbb{R}^N))}. \]

As previously, at this step, we can conclude that the left-hand side of (4.7) goes to zero. It remains to be shown that
\[ \nabla D_\alpha \rightarrow 0 \text{ in } L^\infty([0,T]; L^{2\sigma+2}(\mathbb{R}^N)) \cap L^\infty([0,T]; L^2(\mathbb{R}^N)) \forall T < T^*. \]

As,
\[ \nabla D_\alpha(t) = \int_0^t S_{\parallel}(t-s)\nabla P_{\parallel}(|E_{\alpha \parallel}| + E_{\alpha \perp})^2(E_{\alpha \parallel} + E_{\alpha \perp}) - |E|^{2\sigma}E(s)ds, \]

applying the proposition 2.1, we have
\[ |\nabla D_\alpha|_{L^q([0,T]; L^{2\sigma+2}(\mathbb{R}^N)) \cap L^\infty([0,T]; L^2(\mathbb{R}^N))} \leq C \left( |E_{\alpha \parallel}|^{2\sigma} - |E|^{2\sigma}E \right)_{L^{q'}([0,T]; L^{2\sigma+2}(\mathbb{R}^N))}. \]

The right-hand side is treated as in the previous section to establish the Lemma 3.4. We recall these estimates.
\[ |\nabla(|E_{\alpha \parallel}|^{2\sigma}E_{\alpha} - |E|^{2\sigma}E)|_{L^{q'}([0,T]; L^{2\sigma+2}(\mathbb{R}^N))} \leq c |E_{\alpha \parallel}|^{2\sigma} |\nabla E_{\alpha} - E|_{L^{q'}([0,T]; L^{2\sigma+2}(\mathbb{R}^N))} \]
\[ + c \left( |E_{\alpha \parallel}|^{2-1}_{L^\infty([0,T]; L^{2\sigma+2}(\mathbb{R}^N))} + |E|^{2-1}_{L^\infty([0,T]; L^{2\sigma+2}(\mathbb{R}^N))} \right) |\nabla E|_{L^{q'}([0,T]; L^{2\sigma+2}(\mathbb{R}^N))} |E_{\alpha \parallel} - E|_{L^\infty([0,T]; L^{2\sigma+2}(\mathbb{R}^N))}. \]

As \( H^1(\mathbb{R}^N) \subset L^{2\sigma+2}(\mathbb{R}^N) \) \((\sigma < 2\frac{2}{N-2})\), and from Hölder inequality, we obtain
\[ |\nabla D_\alpha|_{L^q([0,T]; L^{2\sigma+2}(\mathbb{R}^N)) \cap L^\infty([0,T]; L^2(\mathbb{R}^N))} \leq \]
\[ c \left( |E_{\alpha \parallel}|^{2-1}_{L^\infty([0,T]; H^1(\mathbb{R}^N))} + |E|^{2-1}_{L^\infty([0,T]; H^1(\mathbb{R}^N))} + |E|^{2-1}_{L^\infty([0,T]; H^1(\mathbb{R}^N))} \right) |\nabla E|_{L^{q'}([0,T]; L^{2\sigma+2}(\mathbb{R}^N))} \times T^{\frac{1}{2} - \frac{1}{q'}} |E_{\alpha \parallel} - E|_{L^\infty([0,T]; H^1(\mathbb{R}^N))}. \]
As \( q' < q \), if we choose \( T \) small enough (4.7) and (4.8) ensure that
\[
|D_\alpha|_{W^{1,q}([0,T];L^{2\alpha+2}\mathbb{R}^N)} \cap L^\infty([0,T];H^1(\mathbb{R}^N)) \leq \frac{1}{2} |D_\alpha + E_\alpha|_{L^q([0,T];L^{2\alpha+2}\mathbb{R}^N)} \cap L^\infty([0,T];H^1(\mathbb{R}^N)).
\]
That is,
\[
|D_\alpha|_{W^{1,q}([0,T];L^{2\alpha+2}\mathbb{R}^N)} \cap L^\infty([0,T];H^1(\mathbb{R}^N)) \leq |E_\alpha|_{L^q([0,T];L^{2\alpha+2}\mathbb{R}^N)} \cap L^\infty([0,T];H^1(\mathbb{R}^N)).
\]
We then have shown that \( D_\alpha \) goes to zero when \( \alpha \) goes to infinity in
\[
W^{1,q}([0,T];L^{2\alpha+2}\mathbb{R}^N) \cap L^\infty([0,T];H^1(\mathbb{R}^N))
\]
as soon as \( T \) is small enough. In fact, we have the same results for all \( T < T^* \). Assume that there exists \( T_m < T^* \) such that
\[
D_\alpha \to 0 \text{ in } W^{1,q}([0,T_m];L^{2\alpha+2}\mathbb{R}^N) \cap L^\infty([0,T];H^1(\mathbb{R}^N)) \quad \forall T < T_m.
\]
As previously, we show that there exists \( \delta > 0 \) \( (\delta < T^* - T_m) \) such that
\[
|D_\alpha|_{W^{1,q}([T,T+\delta];L^{2\alpha+2}\mathbb{R}^N)} \cap L^\infty([T,T+\delta];H^1(\mathbb{R}^N)) \leq C|D_\alpha(T)|_{H^1(\mathbb{R}^N)} + |E_\alpha|_{L^\infty([T,T+\delta];H^1(\mathbb{R}^N))} \cap L^q([T,T+\delta];L^{2\alpha+2}\mathbb{R}^N)).
\]
By virtue of the first part of (4.9), we have
\[
D_\alpha(T) \to 0 \text{ in } H^1(\mathbb{R}^N), \quad (T < T_m).
\]
Also,
\[
E_\alpha \to 0 \text{ in } L^\infty([T,T+\delta];H^1(\mathbb{R}^N)) \cap L^q([T,T+\delta];L^{2\alpha+2}\mathbb{R}^N)).
\]
Let us choose \( T = T_m - \frac{\delta}{2} \), then the second relation of (4.9) is false. The Theorem 4.2 is so proved. 

The author wish to thank the professors T. Colin and P. Fabrie, for their helpful remarks and their suggestions.
