# THE TAUTOLOGICAL RING OF $M_{1, n}^{c t}$ 

by Mehdi TAVAKOL

#### Abstract

We describe the tautological ring of the moduli space of stable $n$-pointed curves of genus one of compact type. It is proven that it is a Gorenstein algebra.

Résumé. - Nous décrivons l'anneau tautologique de l'espace des modules des courbes stables de genre un de type compact avec $n$ points marqués. On prouve que c'est une algèbre de Gorenstein.

## Introduction

Let $M_{g, n}^{c t}$ be the moduli space of stable $n$-pointed genus $g$ curves of compact type and denote by $R^{*}\left(M_{g, n}^{c t}\right)$ its tautological ring. Here, we study this ring in genus one. It is known that the tautological ring $R^{*}\left(M_{1, n}^{c t}\right)$ is additively generated by boundary cycles, and it is the subalgebra of the Chow ring $A^{*}\left(M_{1, n}^{c t}\right)$ (taken with $\mathbb{Q}$-coefficients throughout) of $M_{1, n}^{c t}$ generated by divisor classes $D_{I}$, for $I \subset\{1, \ldots, n\}$ with $|I|>1$. For example, see the appendix of [11]. Recall that a boundary cycle of $M_{1, n}^{c t}$ parameterizes stable curves whose dual graphs are trees, and $D_{I}$ is associated to those with one edge, for which $I$ is the marking set on the genus zero component. We study this ring to understand the space of relations among the generators. In particular, we prove that the tautological ring is Gorenstein.

We begin this note by recalling the definitions and known facts about the tautological algebras as well as the conjectural structure of them.

In the second section we consider a fixed pointed elliptic curve $(C ; O)$, and we describe the reduced fiber of the projection $M_{1, n}^{c t} \rightarrow M_{1,1}^{c t}$ over
$[(C ; O)] \in M_{1,1}^{c t}$, which is denoted by $\bar{U}_{n-1}$, as a sequence of blow-ups of $C^{n-1}$. As a result, we get a map

$$
F: \bar{U}_{n-1} \rightarrow M_{1, n}^{c t}
$$

There is a description of the Chow ring $A^{*}\left(\bar{U}_{n-1}\right)$ of $\bar{U}_{n-1}$ in the third section.

Then we define the tautological ring $R^{*}\left(C^{n}\right)$ of $C^{n}$ as a subring of its Chow ring $A^{*}\left(C^{n}\right)$. We give a description of the pairing

$$
R^{d}\left(C^{n}\right) \times R^{n-d}\left(C^{n}\right) \rightarrow \mathbb{Q}
$$

for $0 \leqslant d \leqslant n$. In particular, we will see that this pairing is perfect.
The fifth section starts with the definition of the tautological ring $R^{*}\left(\bar{U}_{n-1}\right)$ of $\bar{U}_{n-1}$. It is defined to be the subalgebra of its Chow ring generated by the tautological classes in $R^{*}\left(C^{n-1}\right)$ and the classes of proper transforms of the exceptional divisors introduced in the construction of $\bar{U}_{n-1}$. The study of the pairing

$$
R^{d}\left(\bar{U}_{n-1}\right) \times R^{n-1-d}\left(\bar{U}_{n-1}\right) \rightarrow \mathbb{Q}
$$

for $0 \leqslant d \leqslant n-1$, shows that it is perfect as well.
In the last section we study the fibers of the map $F: \bar{U}_{n-1} \rightarrow M_{1, n}^{c t}$, and we will see that the images of the tautological classes in $M_{1, n}^{c t}$ under the induced pull-back

$$
F^{*}: A^{*}\left(M_{1, n}^{c t}\right) \rightarrow A^{*}\left(\bar{U}_{n-1}\right)
$$

are elements of the tautological ring $R^{*}\left(\bar{U}_{n-1}\right)$ of $\bar{U}_{n-1}$ and hence, it induces a map

$$
R^{*}\left(M_{1, n}^{c t}\right) \rightarrow R^{*}\left(\bar{U}_{n-1}\right),
$$

which is denoted by the same letter $F^{*}$, by abuse of notation. Then, we will see that $F^{*}$ induces an isomorphism between the tautological rings involved. This gives a description of the ring $R^{*}\left(M_{1, n}^{c t}\right)$ in terms of the generators $D_{I}$ 's and the space of relations. This leads us to a proof of the following result:

Theorem 0.1. - The ring homomorphism $F^{*}: R^{*}\left(M_{1, n}^{c t}\right) \rightarrow R^{*}\left(\bar{U}_{n-1}\right)$ is an isomorphism. In particular, for any $0 \leqslant d \leqslant n-1$, the pairing

$$
R^{d}\left(M_{1, n}^{c t}\right) \times R^{n-1-d}\left(M_{1, n}^{c t}\right) \rightarrow \mathbb{Q}
$$

is perfect. In other words, $R^{*}\left(M_{1, n}^{c t}\right)$ is a Gorenstein ring.
Acknowledgments. - The author wishes to thank Carel Faber for introducing this project and useful discussions. The comments of Eduard Looijenga and Rahul Pandharipande are appreciated as well. This research
was done during my graduate studies at KTH, the Royal Institute of Technology.

## 1. Review of known facts and conjectures about the tautological ring $R^{*}\left(M_{g, n}^{c t}\right)$

Let $\bar{M}_{g, n}$ be the moduli space of stable curves of genus $g$ with $n$ marked points. In [8] the system of tautological rings is defined to be the set of smallest $\mathbb{Q}$-subalgebras of the Chow rings,

$$
R^{*}\left(\bar{M}_{g, n}\right) \subset A^{*}\left(\bar{M}_{g, n}\right)
$$

satisfying the following two properties:

- The system is closed under push-forward via all maps forgetting markings:

$$
\pi_{*}: R^{*}\left(\bar{M}_{g, n}\right) \rightarrow R^{*}\left(\bar{M}_{g, n-1}\right)
$$

- The system is closed under push-forward via all gluing maps:

$$
\begin{gathered}
\iota_{*}: R^{*}\left(\bar{M}_{g_{1}, n_{1} \cup\{*\}}\right) \otimes R^{*}\left(\bar{M}_{g_{2}, n_{2} \cup\{\bullet\}}\right) \rightarrow R^{*}\left(\bar{M}_{g_{1}+g_{2}, n_{1}+n_{2}}\right), \\
\iota_{*}: R^{*}\left(\bar{M}_{g, n \cup\{*, \bullet\}}\right) \rightarrow R^{*}\left(\bar{M}_{g+1, n}\right),
\end{gathered}
$$

with attachments along the markings $*$ and $\bullet$.
The quotient $R^{*}\left(M_{g, n}\right)$ of the tautological ring is defined as the restriction to the open subset $M_{g, n}$. In [3] it was conjectured that the tautological ring $R^{*}\left(M_{g}\right)$ is a Gorenstein algebra with socle in degree $g-2$. It was raised as a question in [14] whether the tautological ring of $\bar{M}_{g, n}$ satisfy Poincaré duality and has the Lefschetz property with respect to $\kappa_{1}$, which was known to be ample [2]. In [4] the following conjecture about the tautological ring $R^{*}\left(\bar{M}_{g, n}\right)$ is stated:

Conjecture 1.1. - $R^{*}\left(\bar{M}_{g, n}\right)$ is Gorenstein with socle in degree $3 g-3+n$.

We now define the moduli space $M_{g, n}^{c t}$ and its tautological ring. To every stable $n$-pointed curve $\left(C ; x_{1}, \ldots, x_{n}\right)$ there is an associated dual graph. Its vertices correspond to the irreducible components of $C$ and edges correspond to intersection of components. Note that self intersection is allowed. The curve $C$ is of compact type if its dual graph is a tree, or equivalently, the Jacobian of $C$ is an abelian variety. The moduli space $M_{g, n}^{c t}$ parametrizes stable $n$-pointed curves of genus $g$ of compact type. One can also define $M_{g, n}^{c t}$ as the complement of the boundary divisor $\Delta_{i r r}$ of irreducible singular curves and their degenerations.

The tautological ring, $R^{*}\left(M_{g, n}^{c t}\right) \subset A^{*}\left(M_{g, n}^{c t}\right)$, for the moduli space $M_{g, n}^{c t}$, is defined to be the image of $R^{*}\left(\bar{M}_{g, n}\right)$ via the natural map,

$$
R^{*}\left(\bar{M}_{g, n}\right) \subset A^{*}\left(\bar{M}_{g, n}\right) \rightarrow A^{*}\left(M_{g, n}^{c t}\right)
$$

The quotient ring $R^{*}\left(M_{g, n}^{c t}\right)$ admits a canonical non-trivial linear evaluation $\epsilon$ to $\mathbb{Q}$ obtained by integration involving the $\lambda_{g}$ class, the Euler class of the Hodge bundle.

Recall that the Hodge bundle $\mathbb{E}$ on $\bar{M}_{g}$ for $g>1$ (resp. $\bar{M}_{1,1}$ for $g=1$ ), is the locally free $Q$-sheaf of rank $g$ defined by $\mathbb{E}=\pi_{*} \omega$, where $\pi: \bar{M}_{g, 1} \rightarrow \bar{M}_{g}$ (resp. $\pi: \bar{M}_{1,2} \rightarrow \bar{M}_{1,1}$ ) is the universal curve of genus $g$ and $\omega$ denotes its relative dualizing sheaf. The Hodge bundle on $\bar{M}_{g, n}$ is defined as the pull-back of $\mathbb{E}$ via the natural projection $\pi: \bar{M}_{g, n} \rightarrow \bar{M}_{g}$ for $g>1$ (resp. $\pi: \bar{M}_{1, n} \rightarrow \bar{M}_{1,1}$ for $g=1$ ) and is denoted by the same letter. The fiber of $\mathbb{E}$ over a moduli point $\left[\left(C ; x_{1}, \ldots, x_{n}\right)\right]$ is the $g$-dimensional vector space $H^{0}\left(C, \omega_{C}\right)$. The class $\lambda_{i}$ on $\bar{M}_{g, n}$ is defined to be the $i^{t h}$ Chern class $c_{i}(\mathbb{E})$ of the Hodge bundle.

The class $\psi_{i}$ is the pull back $\sigma_{i}^{*}(K)$ of $K$ along $\sigma_{i}: \bar{M}_{g, n} \rightarrow \bar{M}_{g, n+1}$, where $\sigma_{1}, \ldots, \sigma_{n}$ are the natural sections of the map $\pi: \bar{M}_{g, n+1} \rightarrow \bar{M}_{g, n}$, which forgets the last marking on the curve and stabilizes, and $K$ is the class of the relative dualizing sheaf of the projection $\pi$. It is the first Chern class of the cotangent line bundle $\mathbb{L}_{i}$ on the moduli space whose fiber at the moduli point $\left[\left(C ; x_{1}, \ldots, x_{n}\right)\right]$ is the cotangent space to $C$ at the $i^{t h}$ marking. The class $\kappa_{i}$ on $\bar{M}_{g, n}$ is defined to be the push-forward $\pi_{*}\left(\psi_{n+1}^{i+1}\right)$, where the projection $\pi: \bar{M}_{g, n+1} \rightarrow \bar{M}_{g, n}$ is defined as above. The $\psi, \kappa$ and $\lambda$ classes in $A^{*}\left(\bar{M}_{g, n}\right)$ all lie in the tautological ring.

The class $\lambda_{g}$ vanishes when restricted to the complement $\Delta_{i r r}$. This gives rise to an evaluation $\epsilon$ on $A^{*}\left(M_{g, n}^{c t}\right)$ :

$$
\xi \mapsto \epsilon(\xi)=\int_{\bar{M}_{g, n}} \xi \cdot \lambda_{g}
$$

The non-triviality of the $\epsilon$ evaluation is proven by explicit integral computations. The following formula for $\lambda_{g}$ integrals is proven in [7]:

$$
\int_{\bar{M}_{g, n}} \psi_{1}^{\alpha_{1}} \cdots \psi_{n}^{\alpha_{n}} \lambda_{g}=\binom{2 g-3+n}{\alpha_{1}, \ldots, \alpha_{n}} \int_{\bar{M}_{g, 1}} \psi_{1}^{2 g-2} \lambda_{g}
$$

The integrals on the right side are evaluated in terms of the Bernoulli numbers:

$$
\int_{\bar{M}_{g, 1}} \psi_{1}^{2 g-2} \lambda_{g}=\frac{2^{2 g-1}-1}{2^{2 g-1}} \frac{\left|B_{2 g}\right|}{(2 g)!} .
$$

This proves the non-triviality of the evaluation since $B_{2 g}$ doesn't vanish.

It is proven in [12] that $R^{*}\left(M_{g, n}^{c t}\right)$ vanishes in degrees $>2 g-3+n$ and is 1 -dimensional in degree $2 g-3+n$. It was speculated in $[6]$ that $R^{*}\left(M_{g}^{c t}\right)$ is a Gorenstein algebra with socle in codimension $2 g-3$. The following conjecture is stated in [4]:

Conjecture 1.2. - $R^{*}\left(M_{g, n}^{c t}\right)$ is Gorenstein with socle in degree $2 g-3+n$.

A compactly supported version of the tautological algebra is defined in [14]. The algebra $R_{c}^{*}\left(M_{g, n}\right)$ is defined to be the set of elements in $R^{*}\left(\bar{M}_{g, n}\right)$ that restrict trivially to the Deligne-Mumford boundary. This is a graded ideal in $R^{*}\left(\bar{M}_{g, n}\right)$ and the intersection product defines a map

$$
R^{*}\left(M_{g, n}\right) \times R_{c}^{*}\left(M_{g, n}\right) \rightarrow R_{c}^{*}\left(M_{g, n}\right)
$$

that makes $R_{c}^{*}\left(M_{g, n}\right)$ a $R^{*}\left(M_{g, n}\right)$-module. In [14] they formulated the following conjecture for the case $n=0$ :

Conjecture 1.3.
(A) The intersection pairings

$$
R^{k}\left(M_{g}\right) \times R_{c}^{3 g-3-k}\left(M_{g}\right) \rightarrow R_{c}^{3 g-3}\left(M_{g}\right) \cong \mathbb{Q}
$$

are perfect for $k \geqslant 0$.
(B) In addition to $(A), R_{c}^{*}\left(M_{g}\right)$ is a free $R^{*}\left(M_{g}\right)$-module of rank one.

In a similar fashion one defines $R_{c}^{*}\left(M_{g, n}^{c t}\right)$ as the set of elements in $R^{*}\left(\bar{M}_{g, n}\right)$ that pull back to zero via the standard map $\bar{M}_{g-1, n+2} \rightarrow \bar{M}_{g, n}$ onto $\Delta_{\text {irr }}$. The analogue of the conjectures above for the spaces $M_{g, n}^{c t}$ instead of $M_{g}$ and its relation with the conjecture 1.2 is discussed in [5]. First consider the analogue of the conjectures 1.3 as follows:

Conjecture 1.4.
(C) The intersection pairings

$$
R^{k}\left(M_{g, n}^{c t}\right) \times R_{c}^{3 g-3+n-k}\left(M_{g, n}^{c t}\right) \rightarrow R_{c}^{3 g-3+n}\left(M_{g, n}^{c t}\right) \cong \mathbb{Q}
$$

are perfect for $k \geqslant 0$.
(D) In addition to $(C), R_{c}^{*}\left(M_{g, n}^{c t}\right)$ is a free $R^{*}\left(M_{g, n}^{c t}\right)$-module of rank one.

In [5] it is proven that for a given $(g, n)$, the statement (D) in 1.4 follows if the statements 1.1 and 1.2 hold. On the other hand, for such $(g, n)$ the statements 1.2 and (C) in 1.4 follow from (D) in 1.4. It is also proven that a counterexample to the conjecture 1.1 leads to a disproof of the conjecture $(\mathrm{C})$ in 1.4.

In this note we consider the case $g=1$ and prove that the conjecture 1.2 is true in this case.

## 2. The space $\bar{U}_{n-1}$

Let $C$ be a fixed elliptic curve and choose a point $O \in C$ as its origin. For a given natural number $n \in \mathbb{N}$, the space $U_{n-1}$ is defined to be the open subset

$$
\left\{\left(x_{1}, \ldots, x_{n-1}\right) \in C^{n-1}: x_{i} \neq O \text { and } x_{i} \neq x_{j} \text { for } i \neq j\right\}
$$

of $C^{n-1}$. The projection $\pi: U_{n-1} \times C \rightarrow U_{n-1}$ admits $n$ disjoint sections with smooth fibers and defines a map

$$
F: U_{n-1} \rightarrow M_{1, n}
$$

where $M_{1, n}$ denotes the moduli space of smooth $n$-pointed curves of genus one. The map $F$ sends the point $P=\left(x_{1}, \ldots, x_{n-1}\right)$ of $U_{n-1}$ to the class of the pointed curve $\left(C ; x_{1}, \ldots, x_{n-1}, O\right)$.

For a proper subset $I$ of $\{1, \ldots, n\}$, let $X_{I} \subset C^{n-1}$ be the $|I|$-dimensional subvariety defined by

$$
\left\{\begin{array}{lll}
x_{i}=x_{j} & \text { for } i, j \in\{1, \ldots, n\}-I & \text { if } n \in I \\
x_{i}=O & \text { for } i \in\{1, \ldots, n-1\}-I & \text { if } n \notin I
\end{array}\right.
$$

The space $\bar{U}_{n-1}$ is constructed from $C^{n-1}$ by the following sequence of blow-ups: At step zero blow-up $C^{n-1}$ at the point $X_{0}$, and at the $k^{t h}$ step, for $1 \leqslant k \leqslant n-3$, blow-up the space obtained in the previous step along the regularly embedded union of the proper transforms of the subvarieties $X_{I}$, where $|I|=k$.

The space $\bar{U}_{n-1}$ contains $U_{n-1}$ as an open dense subset. There exists a family of stable curves of genus one of compact type over $\bar{U}_{n-1}$, whose total space is isomorphic to $\bar{U}_{n}$. The resulting family is denoted by $\pi$ : $\bar{U}_{n} \rightarrow \bar{U}_{n-1}$ by abuse of notation. Since $\pi^{-1}\left(U_{n-1}\right)$ is isomorphic to the product $U_{n-1} \times C$, on which $\pi$ is projection onto the first factor, and this coincides with the former definition of $\pi$ given above, there is no danger of confusion. The map $\pi$ admits $n$ disjoint sections in the smooth locus of the fibers, and defines a morphism

$$
F: \bar{U}_{n-1} \rightarrow M_{1, n}^{c t}
$$

The morphism $F$ sends a geometric point $P \in \bar{U}_{n-1}$ to the moduli point of the pointed curve $\left(\pi^{-1}(P) ; x_{1}, \ldots, x_{n}\right)$, where the $x_{i}$ 's are the $n$ distinct
points on the fiber $\pi^{-1}(P)$ obtained by intersecting the fiber $\pi^{-1}(P)$ with the $n$ disjoint sections of $\pi$.

## 3. The Chow ring $A^{*}\left(\bar{U}_{n-1}\right)$

In this section we recall some facts about the intersection ring of the blow-up $\tilde{Y}$ of a smooth variety $Y$ along a smooth irreducible subvariety $Z$ from [9]. When the restriction map from $A^{*}(Y)$ to $A^{*}(Z)$ is surjective, S . Keel has shown in [16] that the computations become simpler. Assuming the surjectivity of the restriction map, we denote the kernel of the restriction map by $J_{Z / Y}$ so that

$$
A^{*}(Z)=\frac{A^{*}(Y)}{J_{Z / Y}}
$$

Define a Chern polynomial for $Z \subset Y$, denoted by $P_{Z / Y}(t)$, to be a polynomial

$$
P_{Z / Y}(t)=t^{d}+a_{1} t^{d-1}+\cdots+a_{d-1} t+a_{d} \in A^{*}(Y)[t]
$$

where $d$ is the codimension of $Z$ in $Y$ and $a_{i} \in A^{i}(Y)$ is a class whose restriction in $A^{i}(Z)$ is $c_{i}\left(N_{Z / Y}\right)$, where $N_{Z / Y}$ is the normal bundle of $Z$ in $Y$. We also require that $a_{d}=[Z]$, while the other classes $a_{i}$, for $0<i<d$, are determined only modulo $J_{Z / Y}$.

Let us verify the surjectivity of the restriction map from $A^{*}(Y)$ to $A^{*}(Z)$ in our case, when $Y=C^{n-1}$ and $Z=X_{I}$, for a subset $I$ of the set $\{1, \ldots, n\}$. First assume that $n$ doesn't belong to the set $I$. Denote by $i_{I}: X_{I} \rightarrow C^{n-1}$ the inclusion map and by $\pi: C^{n-1} \rightarrow X_{I}$ the canonical projection. From the equality $\pi \circ i_{I}=i d_{X_{I}}$ we conclude that the restriction map $i_{I}^{*}$ is surjective. It also follows that the push-forward map $\left(i_{I}\right)_{*}$ is injective. This will be used in 5.1. The case $n \in I$ is treated in a similar manner. In this case there is not a canonical projection $\pi: C^{n-1} \rightarrow X_{I}$, and one has to make a choice.

The following lemma can be used to compute $P_{Z / Y}$ when the subvariety $Z$ is a transversal intersection of divisor classes:

Lemma 3.1.
(a) If $Z=D$ is a divisor, then $P_{D / Y}(t)=t+D$.
(b) If $V \subset Y$ and $W \subset Y$ are subvarieties meeting transversally in a variety $Z$, and $V$ and $W$ have Chern polynomials $P_{V / Y}(t)$ and $P_{W / Y}(t)$, then $Z$ has a Chern polynomial

$$
P_{Z / Y}(t)=P_{V / Y}(t) \cdot P_{W / Y}(t)
$$

In addition the restriction from $A^{*}(Y)[t]$ to $A^{*}(V)[t]$ maps $P_{W / Y}(t)$ to a Chern polynomial $P_{Z / V}(t)$ for $Z \subset V$.

Proof. - This is Lemma 5.1 in [9].
We identify $A^{*}(Y)$ as a subring of $A^{*}(\widetilde{Y})$ by means of the map $\pi^{*}$ : $A^{*}(Y) \rightarrow A^{*}(\widetilde{Y})$, where $\pi: \widetilde{Y} \rightarrow Y$ is the birational morphism. Let $E \subset \widetilde{Y}$ be the exceptional divisor. The formula of Keel is as follows:

Lemma 3.2. - With the above assumptions and notations, the Chow ring $A^{*}(\widetilde{Y})$ is given by

$$
A^{*}(\widetilde{Y})=\frac{A^{*}(Y)[E]}{\left(J_{Z / Y} \cdot E, P_{Z / Y}(-E)\right)}
$$

Proof. - This is Lemma 5.3 in [9].
The next lemma relates a Chern polynomial $P_{\widetilde{V} / \widetilde{Y}}(t)$ of the proper transform $\widetilde{V}$ of a subvariety $V \subset Y$ to $P_{V / Y}(t)$ :

Lemma 3.3. - Let $V$ be a subvariety of $Y$ not contained in $Z$ and let $\widetilde{V} \subset \widetilde{Y}$ be its proper transform. Suppose that $P_{V / Y}(t)$ is a Chern polynomial for $V$.
(1) If $V$ meets $Z$ transversally, then $P_{V / Y}(t)$ is a Chern polynomial for $\widetilde{V}$ in $\widetilde{Y}$.
(2) If $V$ contains $Z$, then $P_{V / Y}(t-E)$ is a Chern polynomial for $\widetilde{V} \subset \widetilde{Y}$.

Proof. - This is Lemma 5.2 in [9].
In the second section we saw that the space $\bar{U}_{n-1}$ is obtained as a result of a sequence of blow-ups of the variety $C^{n-1}$. As we have observed before in this section, the restriction map from the intersection ring of $C^{n-1}$ to $A^{*}(Z)$ is surjective when $Z=X_{I}$ for a subset $I$ of $\{1, \ldots, n\}$. The following lemmas show that the same surjectivity holds for all of the blow-up centers at every step during the process of the construction of $\bar{U}_{n-1}$. They also relate the ideal $J_{\widetilde{V} / \widetilde{Y}}$ to the ideal $J_{V / Y}$ for a subvariety $V$ of $Y$ when we blow-up the variety $Y$ along a subvariety $Z$ assuming the surjectivity of the restriction map $A^{*}(Y) \rightarrow A^{*}(Z)$ :

Lemma 3.4. - Suppose that $V$ is a nonsingular subvariety of $Y$ that intersects $Z$ transversally in an irreducible variety $V \cap Z$, and that the restriction $A^{*}(V) \rightarrow A^{*}(V \cap Z)$ is also surjective. Let $\widetilde{V}=B l_{Z} V$. Then $A^{*}(\tilde{Y}) \rightarrow A^{*}(\widetilde{V})$ is surjective, with kernel $J_{V / Y}$ if $V \cap Z$ is not empty, and kernel $\left(J_{V / Y}, E\right)$ if $V \cap Z$ is empty.

Proof. - This is Lemma 5.4 in [9].

Lemma 3.5. - Suppose that $Z$ is the transversal intersection of nonsingular subvarieties $V$ and $W$ of $Y$, and that the restrictions $A^{*}(Y) \rightarrow A^{*}(V)$ and $A^{*}(Y) \rightarrow A^{*}(W)$ are also surjective, let $\widetilde{V}=B l_{Z} V$. Then
(1) $A^{*}(\widetilde{Y}) \rightarrow A^{*}(\widetilde{V})$ is surjective, with kernel $\left(J_{V / Y}, P_{W / Y}(-E)\right)$;
(2) $A^{*}(\widetilde{Y}) \rightarrow A^{*}(E \cap \widetilde{V})$ is surjective, with kernel $\left(J_{Z / Y}, P_{W / Y}(-E)\right)$.

Proof. - This is Lemma 5.5 in [9].
From now on we will always assume that all of the restriction maps to the blow-up centers are surjective. Using the general results mentioned above we are able to express certain monomials that belong to the Chow ring $A^{*}(\widetilde{Y})$ in terms of elements in $A^{*}(Y)$ :

Lemma 3.6. - Suppose that $Z$ is the transversal intersection $D_{1} \cap \cdots \cap$ $D_{r}$ of divisor classes $D_{1}, \ldots, D_{r}$ on $Y$ and let $f \in A^{*}(Y)$ be an element of degree $d=\operatorname{dim}(Z)$. The following relation holds in $A^{*}\left(B l_{Z} Y\right)$ :

$$
f \cdot E^{r}=(-1)^{r-1} f \cdot Z
$$

Proof. - Multiply both sides of the equality

$$
\left(D_{1}-E\right) \cdots\left(D_{r}-E\right)=0
$$

by $f$. For any element $g \in A^{*}(Y)$ of positive degree, the pull back $i_{Z}^{*}(f g)$ of $f g$ along the inclusion $i_{Z}: Z \rightarrow Y$ is zero, which means that the product $f g \cdot E$ is zero as well. This proves the claim.

We also state the non-vanishing criteria of the product $E_{I} \cdot E_{J}$ for a pair of exceptional divisors $E_{I}$ and $E_{J}$ :

Proposition 3.7.- Let $I, J \subset\{1, \ldots, n\}$ be subsets satisfying $|I|,|J| \leqslant n-3$. The product $E_{I} \cdot E_{J} \in A^{2}\left(\bar{U}_{n-1}\right)$ is zero unless $I \subseteq J$ or $J \subseteq I$ or $I \cup J=\{1, \ldots, n\}$.

Proof. - If $I \cup J \neq\{1, \ldots, n\}$, then $X_{I \cap J}$ is equal to the intersection $X_{I} \cap X_{J}$, and it is a proper subset of $X_{I}$ and $X_{J}$ both if $I \nsubseteq J$ and $J \nsubseteq I$. Under the assumption $I \nsubseteq J, J \nsubseteq I$ and $I \cup J \neq\{1, \ldots, n\}$, the proper transforms of the subvarieties $X_{I}$ and $X_{J}$ become disjoint after blowing up along that of $X_{I \cap J}$. This means that the product $E_{I} \cdot E_{J} \in A^{2}\left(\bar{U}_{n-1}\right)$ is zero.

## 4. The tautological ring $R^{*}\left(C^{n}\right)$

Definition 4.1. - Suppose $(C ; O)$ is a fixed pointed elliptic curve, and let $n \in \mathbb{N}$ be a natural number. The tautological ring, $R^{*}\left(C^{n}\right) \subset A^{*}\left(C^{n}\right)$,
is defined to be the $\mathbb{Q}$-subalgebra generated by the following classes:

$$
\begin{aligned}
a_{i} & =\left\{\left(x_{1}, \ldots, x_{n}\right) \in C^{n}: x_{i}=O\right\}, \\
d_{j, k} & =\left\{\left(x_{1}, \ldots, x_{n}\right) \in C^{n}: x_{j}=x_{k}\right\},
\end{aligned}
$$

where $1 \leqslant i \leqslant n$ and $1 \leqslant j<k \leqslant n$. If we define $b_{j, k}:=d_{j, k}-a_{j}-a_{k}$, then another set of generators for $R^{*}\left(C^{n}\right)$ is $\left\{a_{i}, b_{j, k}: 1 \leqslant i \leqslant n\right.$ and $1 \leqslant j<$ $k \leqslant n\}$.

Proposition 4.2.
(A) Over the polynomial ring with generators $a_{i}, b_{j, k}$ the ideal of relations is generated by the following ones:

$$
\begin{aligned}
& a_{i}^{2}=0, \quad a_{i} b_{i, j}=0, \quad b_{i, j}^{2}=-2 a_{i} a_{j}, \quad b_{i, j} b_{i, k}=a_{i} b_{j, k} \\
& b_{i, j} b_{k, l}+b_{i, k} b_{j, l}+b_{i, l} b_{j, k}=0
\end{aligned}
$$

where in each relation the indices are distinct.
(B) For any $0 \leqslant d \leqslant n$, the pairing $R^{d}\left(C^{n}\right) \times R^{n-d}\left(C^{n}\right) \rightarrow \mathbb{Q}$ is perfect.

Proof. - We first verify that the relations above hold in $R^{2}\left(C^{n}\right)$. The relations $a_{i}^{2}=a_{i} b_{i, j}=0$ and $b_{i, j}^{2}=-2 a_{i} a_{j}$ obviously hold. E. Getzler proved in [10] that the following relation holds in $A^{2}\left(\bar{M}_{1,4}\right)$ :

$$
\begin{equation*}
12 \delta_{2,2}-4 \delta_{2,3}-2 \delta_{2,4}+6 \delta_{3,4}+\delta_{0,3}+\delta_{0,4}-2 \delta_{\beta}=0 \tag{1}
\end{equation*}
$$

where the classes above are defined in [10].
In [17], R. Pandharipande gives a direct construction of Getzler's relation via a rational equivalence in the Chow group $A_{2}\left(\bar{M}_{1,4}\right)$. If we restrict the relation (1) to the space $M_{1,4}^{c t}$, pull it back along the morphism $F: \bar{U}_{3} \rightarrow$ $M_{1,4}^{c t}$, and push it down to $C^{3}$ via the blow-down map, we get the relation

$$
\begin{equation*}
12\left(a_{1} b_{2,3}-b_{1,2} b_{1,3}\right)=0 \tag{2}
\end{equation*}
$$

The pull back of the relation above to $R^{2}\left(\bar{U}_{4}\right)$ via the morphism $\pi: \bar{U}_{4} \rightarrow$ $\bar{U}_{3}$ which forgets the last coordinate gives the relation

$$
\begin{equation*}
12\left(b_{1,2} b_{3,4}+b_{1,3} b_{2,4}+b_{1,4} b_{2,3}\right)=0 \tag{3}
\end{equation*}
$$

For more details about the derivation of (2) and (3), please see the appendix.

Now, we study the pairing

$$
R^{d}\left(C^{n}\right) \times R^{n-d}\left(C^{n}\right) \rightarrow \mathbb{Q}
$$

for $0 \leqslant d \leqslant n$. From the relations above, we see that the tautological group $R^{d}\left(C^{n}\right)$ is spanned by monomials of the form $v=a(v) b(v)$, where $a(v)$ is a product $\prod a_{i}$ of $a_{i}$ 's for $i \in A_{v}$, and $b(v)$ is a product $\prod b_{j, k}$ of $b_{j, k}$ 's, for $j, k \in B_{v}$, such that $A_{v}$ and $B_{v}$ are disjoint subsets of the set $\{1, \ldots, n\}$
satisfying $d=\left|A_{v}\right|+\frac{1}{2}\left|B_{v}\right|$. Under this circumstance, the monomial $v$ is said to be standard. To any standard monomial $v$ we associate a dual element $v^{*} \in R^{n-d}\left(C^{n}\right)$, which is defined to be the product of all $a_{i}$ 's, for $i \in\{1, \ldots, n\}-A_{v} \cup B_{v}$, with $b(v)$. The following lemma enables us to study the pairing:

Lemma 4.3. - Let $v \in R^{d}\left(C^{n}\right)$ and $w \in R^{n-d}\left(C^{n}\right)$ be standard monomials. If the product $v \cdot w$ is nonzero, then $B_{v}=B_{w}$, and the disjoint union of the sets $A_{v}, A_{w}$ and $B_{v}=B_{w}$ is equal to the set $\{1, \ldots, n\}$.

Proof. - By assumption, we obtain the following inequalities:

$$
n=\left(\left|A_{v}\right|+\frac{1}{2}\left|B_{v}\right|\right)+\left(\left|A_{w}\right|+\frac{1}{2}\left|B_{w}\right|\right) \leqslant\left|A_{v}\right|+\left|A_{w}\right|+\left|B_{v} \cup B_{w}\right| \leqslant n .
$$

This forces the inequalities to be equalities. The equality

$$
\left(\left|B_{v} \cup B_{w}\right|-\left|B_{v}\right|\right)+\left(\left|B_{v} \cup B_{w}\right|-\left|B_{w}\right|\right)=0
$$

implies that $\left|B_{v} \cup B_{w}\right|=\left|B_{v}\right|=\left|B_{w}\right|$, which shows that $B_{v}=B_{w}$. The equality $\left|A_{v}\right|+\left|A_{w}\right|+\left|B_{v}\right|=n$ proves the second part of the claim.

So, after a suitable enumeration of generators for $R^{d}\left(C^{n}\right)$, the resulting intersection matrix of the pairing between standard monomials and their dual consists of square blocks along the main diagonal and the off-diagonal blocks are all zero. To prove that the pairing is perfect we need to study the square blocks on the main diagonal. These matrices and their eigenvalues are studied in [15]. In particular, from their result it follows that the kernel of any such matrix is generated by relations of the form (3):

Lemma 4.4. - Let $m \geqslant 2$ be a natural number and $S$ be the set of all standard monomials $v$ of the form $b_{i_{1}, j_{1}} \cdots b_{i_{m}, j_{m}}$ in $R^{m}\left(C^{2 m}\right)$. The kernel of the intersection matrix $(v \cdot w)$ for $v, w$ in $S$ is the ideal generated by expressions of the form

$$
R_{\{i, j, k, l\}}:=b_{i, j} b_{k, l}+b_{i, k} b_{j, l}+b_{i, l} b_{j, k},
$$

where the indices are distinct elements varying over the set $\{1, \ldots, 2 m\}$.
Proof. - The intersection matrix $(v \cdot w)$ for $v, w \in S$ in [15] is denoted by $T_{r}(x)$ for $r=m$ and $x=-2$. The $S_{2 m}$-module generated by elements of $S$ decomposes into the sum $\oplus_{\lambda} V_{\lambda}$, where $\lambda$ varies over all partitions of $2 m$ into even parts. For each such $\lambda$ the space $V_{\lambda}$ is an eigenspace of $T_{r}(x)$. The corresponding eigenvalue is zero when $\lambda \neq 2^{m}$ and it is $(-1)^{m}(m+1)$ ! when $\lambda=2^{m}$. We identify the space $V_{\lambda}$ with a subspace of $R^{m}\left(C^{2 m}\right)$, defined below, which is generated by expressions of the form $R_{\{i, j, k, l\}}$, for $\lambda \neq 2^{m}$.

Recall that a tabloid is an equivalence class of numberings of a Young diagram, two being equivalent if corresponding rows contain the same entries. The tabloid determined by a numbering $T$ is denoted $\{T\}$. The space $V_{\lambda}$ is generated by elements of the form

$$
v_{T}=\sum_{q \in C(T)} \operatorname{sgn}(q)\{q \cdot T\}
$$

where $C(T)$ is the subgroup of $S_{2 m}$ consisting of permutations preserving the columns of $T$.

Note that the sum $R_{\{1, \ldots, 2 m\}}:=\sum_{v \in S} v$ is a symmetric expression, which is clearly a linear combination of terms of the form $R_{T}$, where $|T|=4$. This proves the claim when $\lambda=2 m$ gives the trivial representation. For other partitions $\lambda$ we use the proven result for the symmetric relations. Let $\lambda=$ $\left(\lambda_{1} \geqslant \cdots \geqslant \lambda_{r}>0\right)$ be a partition of $2 m$. For each numbering of a Young diagram $T$ let $T_{i}$ denote the subset of $\{1, \ldots, 2 m\}$ containing elements of the $i^{\text {th }}$ row of $T$, for $i=1, \ldots, r$. Consider the product $P_{T}:=\prod_{i=1}^{r} R_{T_{i}}$, where $R_{\{i, j\}}$ is defined to be $b_{i, j}$, while the other $R_{T_{i}}$ 's are defined above when $\left|T_{i}\right| \geqslant 4$. Note that $P_{T}$ doesn't change as $T$ varies in an equivalence class $\{T\}$ since $R_{T_{i}}$ 's are symmetric. This means that the assignment

$$
v_{T} \rightarrow \sum_{q \in C(T)} \operatorname{sgn}(q) P_{q \cdot T}
$$

is a well-defined $S_{2 m}$-module morphism. This map is non-zero, hence an isomorphism onto its image. The result follows.

Since the relations of the form (3) hold in the tautological ring $R^{*}\left(C^{n}\right)$, we conclude that the pairing is perfect. This also shows that the relations stated in the proposition generate all relations in the tautological ring.

Remark 4.5. - The tautological ring $R^{*}\left(C^{n}\right)$, for a smooth curve $C$ of genus $g$, was defined by C. Faber and R. Pandharipande (unpublished) as the $\mathbb{Q}$-subalgebra of $A^{*}\left(C^{n}\right)$ generated by the standard classes $K_{i}$ and $D_{i, j}$. They show that the image $R H^{*}\left(C^{n}\right)$ in cohomology is Gorenstein. In [13] M. Green and P. Griffiths have shown that $R^{*}\left(C^{2}\right)$ is not Gorenstein, for $C$ a generic complex curve of genus $g \geqslant 4$.

## 5. The tautological ring $R^{*}\left(\bar{U}_{n-1}\right)$

Definition 5.1. - The tautological ring, $R^{*}\left(\bar{U}_{n-1}\right)$ of $\bar{U}_{n-1}$, is defined to be the subalgebra of the Chow ring $A^{*}\left(\bar{U}_{n-1}\right)$ generated by the tautological classes in $R^{*}\left(C^{n-1}\right)$ and the classes $E_{I}$ for $|I| \leqslant n-3$.

### 5.1. Relations in $R^{*}\left(\bar{U}_{n-1}\right)$

- The first class of relations in $R^{*}\left(\bar{U}_{n-1}\right)$ are those between the generators of $R^{*}\left(C^{n-1}\right)$ described in Section 4.
- For subsets $I, J \subset\{1, \ldots, n\}$, where $|I|,|J| \leqslant n-3$, the product $E_{I} \cdot E_{J} \in R^{2}\left(\bar{U}_{n-1}\right)$ is zero unless
$(*) \quad I \subseteq J, \quad$ or $J \subseteq I, \quad$ or $I \cup J=\{1, \ldots, n\}$.
- For any subset $I \subset\{1, \ldots, n\}$, where $|I| \leqslant n-3$, consider the inclusion

$$
i_{I}: X_{I} \rightarrow C^{n-1}
$$

The relations

$$
\left\{x \cdot E_{I}=0: x \in \operatorname{ker}\left(i_{I}^{*}: R^{*}\left(C^{n-1}\right) \rightarrow R^{*}\left(X_{I}\right)\right)\right\}
$$

hold. Note that the kernel of $i_{I}^{*}$ coincides with the kernel of the map

$$
R^{*}\left(C^{n-1}\right) \rightarrow R^{*}\left(C^{n-1}\right)
$$

defined by $x \rightarrow x \cdot X_{I}$. This follows since $\left(i_{I}\right)_{*}\left(i_{I}\right)^{*}(x)=x \cdot X_{I}$ for $x \in R^{*}\left(C^{n-1}\right)$, and $\left(i_{I}\right)_{*}$ is injective in our case.

- As we saw in the third section, in blowing-up the variety $Y$ along a subvariety $Z \subset Y$, if the center $Z$ can be written as the transversal intersection of the subvarieties $V$ and $W$ of $Y$, then the class $P_{W / Y}\left(-E_{Z}\right)$ is in the ideal $J_{\widetilde{V} / \widetilde{Y}}$. This means that the product $P_{W / Y}\left(-E_{Z}\right) \cdot E_{\widetilde{V}}$ is zero, where $E_{\widetilde{V}}$ is the class of the exceptional divisor of the blow-up along the subvariety $\widetilde{V}$. We get a class of relations of this type by writing the centers of blow-ups introduced in the construction of the space $\bar{U}_{n-1}$ as transversal intersections in different ways. If the subvariety $V$ can be written as a transversal intersection $V_{1} \cap \cdots \cap V_{k}$, we obtain the relation $P_{W / Y}\left(-E_{Z}\right) \cdot E_{V_{1}} \cdots E_{V_{k}}=0$.
- For each subvariety $Z \subset Y$ with a Chern polynomial $P_{Z / Y}(t)$, there is a relation

$$
P_{Z / Y}\left(-E_{Z}\right)=0,
$$

where $E_{Z}$ is the class of the exceptional divisor of the blow-up of $Y$ along $Z$. These give another class of relations in $R^{*}\left(\bar{U}_{n-1}\right)$. Note that for each subset $I$ of $\{1, \ldots, n\}$, a Chern polynomial $P_{X_{I} / C^{n-1}}$ of the subvariety $X_{I}$ is in $R^{*}\left(C^{n-1}\right)[t]$. This means that a Chern polynomial of its proper transform under later blow-ups belongs to $R^{*}\left(\bar{U}_{n-1}\right)$. It follows from Lemma 3.3, which relates a Chern polynomial $P_{V / Y}(t)$ of a subvariety $V$ to that of its proper transform $\widetilde{V}$.

Example 5.2. - Suppose $Y=C^{5}$.

- Let $X_{0}$ be the point $O^{5} \in C^{5}$. Then $\operatorname{ker}\left(i^{*}: R^{*}\left(C^{5}\right) \rightarrow R^{*}\left(X_{0}\right)\right)$ consists of all elements of positive degree. It follows that $a_{i} \cdot E_{0}=$ $b_{i, j} \cdot E_{0}=0$ for all $i$ and $j$.
- Let $X_{1}=a_{2} a_{3} a_{4} a_{5}$. From $a_{1} \cap X_{1}=X_{0}$ we get the relation ( $a_{1}-$ $\left.E_{0}\right) \cdot E_{1}=0$. If $X_{1,2,3}=a_{4} a_{5}$ and $X_{4,5,6}=d_{1,2} d_{1,3}$, then the relation $\left(a_{1}-E_{0}\right) \cdot E_{1,2,3} \cdot E_{4,5,6}=0$ follows from the equality $a_{1} \cap X_{1,2,3} \cap X_{4,5,6}=X_{0}$.
- A Chern polynomial of the subvariety $X_{0}$ is $\prod_{i=1}^{5}\left(a_{i}+t\right)$, from which we get the following relation:

$$
\prod_{i=1}^{5}\left(a_{i}-E_{0}\right)=a_{1} a_{2} a_{3} a_{4} a_{5}-E_{0}^{5}=0
$$

There are several special cases of the relations above which will be useful in the definition of standard monomials and in defining the dual elements:

Lemma 5.3. - Let $I$ be a subset of the set $\{1, \ldots, n\}$ with at most $n-3$ elements, containing $n$. For any $i \in I$ and $j, k \in\{1, \ldots, n\}-I$, the following relations hold in $A^{2}\left(\bar{U}_{n-1}\right)$ :

$$
\begin{gathered}
a_{j} \cdot E_{I}=a_{k} \cdot E_{I}, \quad b_{j, k} \cdot E_{I}=-2 a_{j} \cdot E_{I} \\
b_{i, k} \cdot E_{I}=\left(\sum_{J \subseteq I-\{i\}} E_{J}-a_{i}-a_{j}\right) \cdot E_{I}
\end{gathered}
$$

Proof. - Recall that $E_{I}$ is the exceptional divisor of the blow-up along the proper transform of the subvariety

$$
X_{I}=\cap_{j \neq r \in\{1, \ldots, n\}-I} d_{j, r}=\cap_{k \neq r \in\{1, \ldots, n\}-I} d_{k, r}
$$

The equality $a_{j} \cdot E_{I}=a_{k} \cdot E_{I}$ follows since

$$
a_{j}-a_{k} \in \operatorname{ker}\left(i_{I}^{*}: R^{*}\left(C^{n-1}\right) \rightarrow R^{*}\left(X_{I}\right)\right)
$$

where $i_{I}: X_{I} \rightarrow C^{n-1}$ denotes the inclusion. We give another proof as well: From the following equality

$$
X_{I} \cap a_{j}=X_{I} \cap a_{k}=X_{I-\{n\}}
$$

we obtain the relation

$$
\left(a_{j}-\sum_{J \subseteq I-\{n\}} E_{J}\right) \cdot E_{I}=\left(a_{k}-\sum_{J \subseteq I-\{n\}} E_{J}\right) \cdot E_{I}=0 .
$$

This gives the first relation after canceling out $\left(\sum_{J \subseteq I-\{n\}} E_{J}\right) \cdot E_{I}$ on both sides.

The second equality results from the definition $b_{j, k}=d_{j, k}-a_{j}-a_{k}$, the relation $d_{j, k} \cdot E_{I}=0$, and from the previous case.

To prove the last statement, first note that $b_{i, k}=d_{i, k}-a_{i}-a_{k}$, by definition. From the equality $X_{I} \cap d_{i, k}=X_{I-\{i\}}$, we get the relation

$$
\left(d_{i, k}-\sum_{J \subseteq I-\{i\}} E_{J}\right) \cdot E_{I}=0
$$

We conclude that

$$
b_{i, k} \cdot E_{I}=\left(\sum_{J \subseteq I-\{i\}} E_{J}-a_{i}-a_{k}\right) \cdot E_{I}
$$

which proves the last statement, using that $a_{j} \cdot E_{I}=a_{k} \cdot E_{I}$.

### 5.2. Standard monomials

The existence of the relations stated above makes it possible to obtain a smaller set of generators for the tautological ring $R^{*}\left(\bar{U}_{n-1}\right)$. Any monomial $v \in R^{d}\left(\bar{U}_{n-1}\right)$ can be written as a product $a(v) b(v) \cdot E(v)$, where $a(v)$ is a product of $a_{i}{ }^{\prime} \mathrm{s}, b(v)$ is a product of $b_{j, k}$ 's, and $E(v)$ is a product of exceptional divisors. To simplify the enumeration of the generators for $R^{*}\left(\bar{U}_{n-1}\right)$, we introduce the directed graph associated to a monomial. We first define an ordering on the polynomial ring

$$
\begin{aligned}
R:=\mathbb{Q}\left[a_{i}, b_{j, k}, E_{I}: 1 \leqslant i \leqslant n-1\right. & , 1 \leqslant j<k \leqslant n-1 \\
& I \subset\{1, \ldots, n\}, \text { where }|I| \leqslant n-3] .
\end{aligned}
$$

Definition 5.4. - Let $I, J \subset\{1, \ldots, n\}$, we say that $I<J$ if

- $|I|<|J|$
- or if $|I|=|J|$ and the smallest element in $I-I \cap J$ is less than the smallest element of $J-I \cap J$.
Put an arbitrary total order on monomials in

$$
\mathbb{Q}\left[a_{i}, b_{j, k}: 1 \leqslant i \leqslant n-1,1 \leqslant j<k \leqslant n-1\right] .
$$

Suppose $v_{1}, v_{2} \in R$ are monomials. We say that $v_{1}<v_{2}$ if we can write them as

$$
v_{1}=a\left(v_{1}\right) b\left(v_{1}\right) \cdot \prod_{r=1}^{r_{0}} E_{I_{r}}^{i_{r}} \cdot E, \quad \text { and } v_{2}=a\left(v_{2}\right) b\left(v_{2}\right) \cdot \prod_{r=1}^{r_{0}} E_{I_{r}}^{j_{r}} \cdot E
$$

where $E=\prod_{r=r_{0}+1}^{m} E_{I_{r}}^{i_{r}}$, for $I_{1}<\cdots<I_{m}$, and $i_{r_{0}}<j_{r_{0}}$; or if $r_{0}=0$ and $a\left(v_{1}\right) b\left(v_{1}\right)<a\left(v_{2}\right) b\left(v_{2}\right)$.

Furthermore, we say that $v_{1} \ll v_{2}$, if for any factor $E_{I}$ of $v_{2}$ we have that $v_{1}<E_{I}$.

Definition 5.5. - Let $v=a(v) b(v) \cdot E_{I_{1}}^{i_{1}} \cdots E_{I_{m}}^{i_{m}}$, where $i_{r} \neq 0$ for $r=1, \ldots, m$ and $I_{1}<\cdots<I_{m}$, be a monomial. The directed graph $\mathcal{G}=\left(V_{\mathcal{G}}, E_{\mathcal{G}}\right)$ associated to $v$ is defined by the following data:

- A set $V_{\mathcal{G}}$ and a one-to-one correspondence between members of $V_{\mathcal{G}}$ and members of the set $\{1, \ldots, m\}$. Elements of $V_{\mathcal{G}}$ are called the vertices of $\mathcal{G}$.
- A set $E_{\mathcal{G}} \subset V_{\mathcal{G}} \times V_{\mathcal{G}}$ consisting of all pairs $(r, s)$, where $I_{s}$ is a minimal element of the set

$$
\left\{I_{i}: I_{r} \subset I_{i}\right\}
$$

with respect to inclusion. Elements of $E_{\mathcal{G}}$ are called the edges of $\mathcal{G}$.
For a vertex $i \in V_{\mathcal{G}}$, the closure $\bar{i} \subset V_{\mathcal{G}}$ is defined to be the subset

$$
\left\{r \in V_{\mathcal{G}}: I_{i} \subseteq I_{r}\right\}
$$

of $V_{\mathcal{G}}$. The degree $\operatorname{deg}(i)$ of $i$ is defined to be the number of the elements of the set

$$
\left\{j \in V_{\mathcal{G}}:(i, j) \in E_{\mathcal{G}}\right\}
$$

A vertex $i \in V_{\mathcal{G}}$ is called a root of $\mathcal{G}$ if $I_{i}$ is minimal with respect to inclusion of sets. Maximal vertices of $\mathcal{G}$ are called external and all the other vertices will be called internal.

In the following, we use the letters $I_{1}, \ldots, I_{m}$ to denote the vertices of $\mathcal{G}$.
Remark 5.6. - We can define a directed graph associated to any collection of subsets of the set $\{1, \ldots, n\}$ in a similar way. In general there may be a loop in the resulting graph after forgetting the directions. Loops don't occur in the graph associated to a non-zero monomial $v$. Hence, we refer to $\mathcal{G}$ as the associated forest of the monomial $v$, or of the collection $\left\{I_{1}, \ldots, I_{m}\right\}$.

The next lemma turns out to be useful in defining the dual element:
Lemma 5.7. - Suppose that $I_{1}, \ldots, I_{m}$ are proper subsets of the set $\{1, \ldots, n\}$, containing at most $n-3$ elements, with the property that each pair $I_{r}$ and $I_{s}$ satisfy (*). Let $\mathcal{G}$ be the associated forest. If $n \notin \cap_{r=1}^{m} I_{r}$, then there is a unique root of $\mathcal{G}$ not containing $n$.

Proof. - By assumption, there is a root $I_{r}$ such that $n \notin I_{r}$. Uniqueness follows since for any two roots $I_{r}, I_{s}$ of $\mathcal{G}$ the equality $I_{r} \cup I_{s}=\{1, \ldots, n\}$ holds. This means that their complements $I_{r}^{c}, I_{s}^{c}$ are disjoint. Hence, $n$ belongs to the complement of at most one root.

Definition 5.8. - Let $v$ be as in Definition 5.5, $\mathcal{G}$ be the associated forest, and $J_{1}, \ldots, J_{s}$, for some $s \leqslant m$, be roots of $\mathcal{G}$. For each $1 \leqslant r \leqslant s$ such that $n \in J_{r}$, let $\alpha_{r} \in\{1, \ldots, n\}-J_{r}$ be the smallest element. The subset $S$ of the set $\{1, \ldots, n-1\}$ is defined as follows:

- If $n \in \cap_{r=1}^{m} I_{r}$, put

$$
S:=\left\{\alpha_{1}, \ldots, \alpha_{s}\right\} \cup\left(\cap_{r=1}^{m} I_{r}-\{n\}\right),
$$

- if $n \notin \cap_{r=1}^{m} I_{r}$, let $J_{1}$ be the unique root of $\mathcal{G}$ not containing $n$. In this case

$$
S:=\left\{\alpha_{2}, \ldots, \alpha_{s}\right\} \cup\left(\cap_{r=1}^{m} I_{r}\right) .
$$

The monomial $v$ is said to be standard if

- The monomial $a(v) b(v) \in R^{*}\left(C^{S}\right)$ is in standard form according to the definition given in the fourth section.
- For each $r$ we have that

$$
i_{r} \leqslant \min \left(n-2-\left|I_{r}\right|,\left|\cap_{I_{r} \subset I_{s}} I_{s}\right|-\left|I_{r}\right|+\operatorname{deg}\left(I_{r}\right)-2\right)
$$

We now prove that standard monomials form a basis of the tautological ring:

Proposition 5.9. - The tautological ring $R^{*}\left(\bar{U}_{n-1}\right)$ of $\bar{U}_{n-1}$ is spanned by standard monomials.

Proof. - Let $v$ be a monomial given as in Definition 5.5. We have seen that any monomial in $R^{d}\left(C^{n-1}\right)$ can be written in standard form for $0 \leqslant d \leqslant n-1$. By Lemma 5.3, we may assume that $a(v) b(v)$ is an element of the tautological ring $R^{*}\left(C^{S}\right)$ of $C^{S}$, where $S$ is defined according to Definition 5.8. The statement is proven using induction and from the following observations:

- From the last class of relations in 5.1, for any subset $I_{r}$ of the set $\{1, \ldots, n\}$, where $\left|I_{r}\right| \leqslant n-3$, we can write $E_{I_{r}}^{n-1-\left|I_{r}\right|}$ as a sum of elements which are strictly less than it.
- Let $\left\{J_{1}, \ldots, J_{s}\right\}$ be the set of minimal elements of the set

$$
\left\{I_{i}: I_{r} \subset I_{i}, \text { where } 1 \leqslant i \leqslant m\right\} .
$$

From the third class of relations in 5.1, the monomial $E_{I_{r}}^{j} \cdot \prod_{i=1}^{s} E_{J_{i}}$ can be written as a sum of terms which are strictly less than it, where $j=\left|\cap_{i=1}^{s} J_{i}\right|-\left|I_{r}\right|+s-1$.

### 5.3. Definition of the dual element

Now suppose $v \in R^{d}\left(\bar{U}_{n-1}\right)$ is an element of degree $d$ written in standard form. Below, we define the element $v^{*}$, which is an element of $R^{n-1-d}\left(\bar{U}_{n-1}\right)$. As we will see, the property $v^{* *}=v$ holds. This shows that there is a one-to-one correspondence between standard monomials in degree $d$ and $n-1-d$.

Definition 5.10. - Suppose $v=a(v) b(v) \cdot E(v)$ is a standard monomial, where $a(v) b(v)$ is in the tautological ring $R^{*}\left(C^{n-1}\right)$ of $C^{n-1}$, and

$$
E(v)=\prod_{r=1}^{m} E_{I_{r}}^{i_{r}}
$$

where $i_{r} \neq 0$ for $r=1, \ldots, m$, and $I_{1}<\cdots<I_{m}$. Let $\mathcal{G}$ be the associated forest, and $J_{1}, \ldots, J_{s}$, the set $S$ and $\alpha_{r} \in J_{r}$ for $1 \leqslant r \leqslant s$ be as in Definition 5.8. The subset $T$ of the set $S$ is defined as follows:

- If $n \in \cap_{r=1}^{m} I_{r}$ put

$$
T:=S-\left(A_{v} \cup B_{v} \cup\{n\}\right)
$$

- if $n \notin \cap_{r=1}^{m} I_{r}$, let $J_{1}$ be the unique root of $\mathcal{G}$ not containing $n$. In this case

$$
T:=S-\left(A_{v} \cup B_{v}\right)
$$

For each $1 \leqslant r \leqslant m$, define $j_{r}$ to be

$$
\begin{cases}\left|\cap_{I_{r} \subset I_{s}} I_{s}\right|-\left|I_{r}\right|+\operatorname{deg}\left(I_{r}\right)-1-i_{r} & \text { if } I_{r} \text { is an internal vertex of } \mathcal{G} \\ n-1-\left|I_{r}\right|-i_{r} & \text { if } I_{r} \text { is an external vertex of } \mathcal{G}\end{cases}
$$

We define $v^{*}=a\left(v^{*}\right) b\left(v^{*}\right) \cdot E\left(v^{*}\right)$, where

$$
a\left(v^{*}\right)=\prod_{i \in T} a_{i}, \quad b\left(v^{*}\right)=b(v), \quad E\left(v^{*}\right)=\prod_{r=1}^{m} E_{I_{r}}^{j_{r}} .
$$

Remark 5.11. - We verify that the dual element $v^{*}$ is well-defined. We need to show that the integers $j_{r}$ are non-negative. These integers are indeed positive numbers for $r=1, \ldots, m$. In the definition of standard monomials we have seen that

$$
i_{r} \leqslant\left|\cap_{I_{r} \subset I_{s}} I_{s}\right|-\left|I_{r}\right|+\operatorname{deg}\left(I_{r}\right)-2 .
$$

This shows that $j_{r} \geqslant 1$ when $i_{r}>0$ and $I_{r}$ is an internal vertex. The case of external vertices is treated using the inequality $i_{r} \leqslant n-2-\left|I_{r}\right|$.

The following corollary follows from Definition 5.10.
Corollary 5.12. - Suppose $v \in R^{d}\left(\bar{U}_{n-1}\right)$ is a standard monomial and let $v^{*} \in R^{n-1-d}\left(\bar{U}_{n-1}\right)$ be its dual. Then $v^{*}$ is a standard monomial, and furthermore $v^{* *}=v$.

The next lemma will be useful in the proof of Proposition 5.16 and identity (5):

Lemma 5.13. - Let $v=a(v) b(v) \cdot E(v)$ be as in Definition 5.10, and $\mathcal{G}$ be the associated forest. For a vertex $i \in V_{\mathcal{G}}$ corresponding to the subset $I_{i}$ of the set $\{1, \ldots, n\}$, the equality

$$
\sum_{\bar{i}}\left(i_{r}+j_{r}\right)=n-1-\left|I_{i}\right|
$$

holds. Here $\bar{i}$ is the closure of $i$ in $\mathcal{G}$ defined in Definition 5.5.
Proof. - It is immediate from the definition of the $j_{r}$ 's above.

### 5.4. The pairing $R^{d}\left(\bar{U}_{n-1}\right) \times R^{n-1-d}\left(\bar{U}_{n-1}\right)$

In the previous part, we defined dual elements for standard monomials. Below, we will see that with respect to the ordering of the generators of the Chow groups given in 5.4 the resulting intersection matrix between the standard monomials and their duals consists of square blocks on the main diagonal, whose entries are, up to a sign, intersection numbers in $R^{|S|}\left(C^{S}\right)$, for certain sets $S$, and all blocks below the diagonal are zero. To prove the stated properties of the intersection matrix, we introduce a natural filtration ${ }^{(1)}$ on the tautological ring.

Definition 5.14. - Let $v$ be a standard monomial as given in Definition 5.8, and let $J_{1}, \ldots, J_{s}$ be roots of the associated forest. Define $p(v)$ to be the degree of the element

$$
a(v) b(v) \cap_{r=1}^{s} X_{J_{r}} \in A^{*}\left(C^{n-1}\right)
$$

which is the same as the integer

$$
\operatorname{deg} a(v) b(v)+n-\left|\cap_{r=1}^{s} J_{r}\right|-s
$$

[^0]The subspace $F^{p} R^{*}\left(\bar{U}_{n-1}\right)$ of the tautological ring is defined to be the $\mathbb{Q}$-vector space spanned by standard monomials $v$ satisfying $p(v) \geqslant p$.

Proposition 5.15.
(a) For any integer $p$, we have that $F^{p+1} R^{*}\left(\bar{U}_{n-1}\right) \subseteq F^{p} R^{*}\left(\bar{U}_{n-1}\right)$.
(b) Let $v \in F^{p} R^{*}\left(\bar{U}_{n-1}\right)$ and $w \in R^{d}\left(\bar{U}_{n-1}\right)$ be such that $w \ll v$. If $p+d \geqslant n$, then $v \cdot w$ is zero. In particular, $F^{n} R^{*}\left(\bar{U}_{n-1}\right)$ is zero.

Proof. - The first statement is immediate from Definition 5.14. Let us prove (b). Let $v$ be given as in Definition 5.8. Denote by $Y$ the blow-up of $C^{n-1}$ corresponding to the collection

$$
\left\{J \subset\{1, \ldots, n\}: J<J_{r} \text { for } 1 \leqslant r \leqslant s\right\}
$$

Note that the dimension $\operatorname{dim} \cap_{r=1}^{s} X_{J_{r}}$ of the transversal intersection $\cap_{r=1}^{s} X_{J_{r}}$ is equal to $\left|\cap_{r=1}^{s} J_{r}\right|+s-1$. The product

$$
a(v) b(v) \cdot \prod_{r=1}^{s} \widetilde{X}_{J_{r}} \cdot w \in A^{*}(Y)
$$

is zero since its degree, which is

$$
\operatorname{deg}(a(v) b(v))+n-\left|\cap_{r=1}^{s} J_{r}\right|-s+d
$$

is at least $n$, by assumption. This means that the product

$$
a(v) b(v) \cdot \prod_{r=1}^{s} E_{J_{r}} \cdot w \in R^{*}\left(\bar{U}_{n-1}\right)
$$

which is a factor of $v \cdot w$, is zero as well.
Using the proven lemma we are able to prove the following vanishing result:

Proposition 5.16. - Suppose $v_{1}, v_{2} \in R^{d}\left(\bar{U}_{n-1}\right)$ are standard monomials satisfying $E\left(v_{1}\right)<E\left(v_{2}\right)$. Then $v_{1} \cdot v_{2}^{*}=0$.

Proof. - It is enough to write $v_{1} \cdot v_{2}^{*}$ as a product $v \cdot w$, for $v, w \in$ $R^{*}\left(\bar{U}_{n-1}\right)$ satisfying the properties given in Proposition 5.15. To find $v$ and $w$, let $v_{1}, v_{2}$ be given as in Definition 5.4, and denote by $\left\{J_{1}, \ldots, J_{s}\right\}$ the set of roots of the graph associated to the monomial $E=\prod_{r=r_{0}+1}^{m} E_{I_{r}}^{i_{r}}$. By relabeling the roots we may assume that there is an $s_{0} \geqslant 0$ such that $I_{r_{0}} \subset J_{r}$ for $1 \leqslant r \leqslant s_{0}$, and the equality $I_{r_{0}} \cup J_{r}=\{1, \ldots, n\}$ holds for $s_{0}<r \leqslant s$. Let $w$ be the product of all monomials in $v_{1} \cdot v_{2}^{*}$ which are strictly less than $E_{I_{r_{0}}}$ and $v$ be the product of the other factors, so that
$v_{1} \cdot v_{2}^{*}=v \cdot w$. Notice that $w \ll v$, by the definition of $v$ and $w$. The degree $d$ of $w$ is computed using Lemma 5.13:

$$
\begin{aligned}
d & =n+j_{r_{0}}-i_{r_{0}}+s-s_{0}-\left|I_{r_{0}}^{c}\right|-\sum_{r=s_{0}+1}^{s}\left|J_{r}^{c}\right| \\
& =j_{r_{0}}-i_{r_{0}}+s-s_{0}+\left|I_{r_{0}} \cap J_{s_{0}+1} \cap \cdots \cap J_{s}\right| \\
& \geqslant s-s_{0}+1+\left|I_{r_{0}} \cap J_{s_{0}+1} \cap \cdots \cap J_{s}\right|=n-p(v) .
\end{aligned}
$$

From $d+p(v) \geqslant n$ we see that the product $v \cdot w$ is zero.
To study the blocks on the main diagonal we proceed as follows: We first prove an identity which reduces the number of exceptional divisors in the product for certain monomials. Let $Y$ be a blow-up of $C^{n-1}$ at some step in the construction of $\bar{U}_{n-1}$. Suppose that

$$
V_{1} \cap \cdots \cap V_{k} \cap W=Z
$$

is a transversal intersection of tautological classes, where $W=D_{1} \cap \cdots \cap D_{r}$ is a transversal intersection of divisors $D_{1}, \ldots, D_{r} \in R^{1}(Y)$, and let $f \in$ $R^{*}(Y)$ be an element of degree $d=\operatorname{dim}(Z)$. Denote by $E_{Z}$ the exceptional divisor of the blow-up $B l_{Z} Y$ of $Y$ along $Z$ and by $E_{V_{1}}, \ldots, E_{V_{k}}$ those of the blow-up $\widetilde{Y}$ of $B l_{Z} Y$ along the proper transform of the subvarieties $V_{1}, \ldots, V_{k}$. It follows from Lemma 3.5 that $P_{W / Y}\left(-E_{Z}\right) \in J_{\widetilde{V} / \widetilde{Y}}$, for $V=$ $V_{1} \cap \cdots \cap V_{k}$. Using the same argument as in Lemma 3.6 we observe that the equality

$$
f \cdot E_{Z}^{r} \cdot E_{V_{1}} \cdots E_{V_{k}}=(-1)^{r-1} f \cdot W \cdot E_{V_{1}} \cdots E_{V_{k}}
$$

holds in $R^{r+d+k}(\tilde{Y})$. If the codimension of the subvariety $V_{i}$ is $r_{i}$ and that of $Z$ is $r_{0}$, then from the proven result in Lemma 3.6 one gets the following identity:

$$
\begin{equation*}
f \cdot E_{Z}^{r} \cdot E_{V_{1}}^{r_{1}} \cdots E_{V_{k}}^{r_{k}}=(-1)^{r_{0}-k-1} f \cdot Z \tag{4}
\end{equation*}
$$

Notice that this identity reduces the computation of certain monomials containing the exceptional divisors to one which belongs to the Chow ring $A^{*}(Y)$. We now use this identity to compute the numbers occurring on the main diagonal of the intersection matrix.

Let $I_{1}, \ldots, I_{m}$ be subsets of the set $\{1, \ldots, n\}$ containing at most $n-3$ elements such that for every pair $I_{r}$ and $I_{s}$ the property $(*)$ holds. Let $\mathcal{G}$ be the associated forest of the collection $I_{1}, \ldots, I_{m}$ and $J_{1}, \ldots, J_{s}$, the set $S$ and $\alpha_{r} \in J_{r}$ for $1 \leqslant r \leqslant s$ be as in Definition 5.8. If $n \notin \cap_{r=1}^{m} I_{r}$, let $J_{1}$
be the unique root of $\mathcal{G}$ not containing $n$. Define

$$
E:=\prod_{r=1}^{m} E_{I_{r}}^{i_{r}}
$$

where

$$
i_{r}= \begin{cases}\left|\cap_{I_{r} \subset I_{s}} I_{s}\right|-\left|I_{r}\right|+\operatorname{deg}\left(I_{r}\right)-1 & \text { if } I_{r} \text { is an internal vertex of } \mathcal{G} \\ n-1-\left|I_{r}\right| & \text { if } I_{r} \text { is an external vertex of } \mathcal{G}\end{cases}
$$

Consider an element $f \in \mathbb{Q}\left[a_{i}, b_{i, j}: i, j \in S\right]$, of degree $\left|\cap_{r=1}^{m} I_{r}\right|+s-1$.
Then from the identity (4) it follows that

$$
\begin{equation*}
f \cdot E=(-1)^{\varepsilon} f \cdot \prod_{i \in\{1, \ldots, n-1\}-S} a_{i} . \tag{5}
\end{equation*}
$$

where $\varepsilon=n+\left|\cap_{r=1}^{m} I_{r}\right|+\sum_{i \in V(G)} \operatorname{deg}(i)$, using Lemma 5.13.
Note that for any $v \in R^{d}\left(\bar{U}_{n-1}\right)$, the product $E:=E(v) \cdot E\left(v^{*}\right)$ is in the form given above according to Definition 5.10.

Theorem 5.17. - For any $0 \leqslant d \leqslant n-1$, the pairing

$$
R^{d}\left(\bar{U}_{n-1}\right) \times R^{n-1-d}\left(\bar{U}_{n-1}\right) \rightarrow \mathbb{Q}
$$

is perfect.
Proof. - Let $A:=\left\{v_{1}, \ldots, v_{r}\right\} \subset R^{d}\left(\bar{U}_{n-1}\right)$, where $v_{1}<\cdots<v_{r}$, be the set of standard monomials of degree $d$, and $\left\{v_{1}^{*}, \ldots, v_{r}^{*}\right\} \subset R^{n-1-d}\left(\bar{U}_{n-1}\right)$ be the set of their duals defined above. For a monomial

$$
E \in \mathbb{Q}\left[E_{I}: I \subset\{1, \ldots, n\} \text { and }|I| \leqslant n-3\right]
$$

define

$$
A_{E}:=\{v \in A: E(v)=E\}
$$

Let $\mathcal{G}$ be the graph associated to the monomial $E$, and define $S$ as in Definition 5.8. For $v_{i}, v_{j} \in A_{E}$ the number

$$
v_{i} \cdot v_{j}^{*} \in R^{n-1}\left(\bar{U}_{n-1}\right)=\mathbb{Q}
$$

is the same as

$$
(-1)^{\varepsilon} a\left(v_{i}\right) b\left(v_{i}\right) \cdot a\left(v_{j}^{*}\right) b\left(v_{j}^{*}\right) \in R^{S}\left(C^{S}\right)=\mathbb{Q}
$$

by the identity (5), where $\varepsilon=n+\left|\cap_{r=1}^{m} I_{r}\right|+\sum_{i \in V(\mathcal{G})} \operatorname{deg}(i)$.
This means that the intersection matrices $\left(v_{i} \cdot v_{j}^{*}\right)$ and $\left(a\left(v_{i}\right) b\left(v_{i}\right)\right.$ - $\left.a\left(v_{j}^{*}\right) b\left(v_{j}^{*}\right)\right)$, for $v_{i}, v_{j}$ in the set $A_{E}$, are the same up to a sign after the identifications above. From the study of the tautological ring $R^{*}\left(C^{S}\right)$ of $C^{S}$, we know that the kernel of the matrix above is generated by relations
in $R^{*}\left(C^{S}\right)$. After choosing a basis for $R^{d-\operatorname{deg}(E)}\left(C^{S}\right)$, the resulting matrix is invertible. It means that the intersection matrix of the pairing

$$
R^{d}\left(\bar{U}_{n-1}\right) \times R^{n-1-d}\left(\bar{U}_{n-1}\right) \rightarrow \mathbb{Q}
$$

with this choice of basis elements for the tautological groups consists of invertible blocks on the main diagonal and zero blocks below the diagonal, hence is invertible. This proves the claim.

## 6. The tautological ring $R^{*}\left(M_{1, n}^{c t}\right)$

In the first part we obtained the morphism $F: \bar{U}_{n-1} \rightarrow M_{1, n}^{c t}$, induced from the family of curves $\pi: \bar{U}_{n} \rightarrow \bar{U}_{n-1}$. The morphism $F$ induces a ring homomorphism

$$
F^{*}: A^{*}\left(M_{1, n}^{c t}\right) \rightarrow A^{*}\left(\bar{U}_{n-1}\right)
$$

For a subset $J \subset\{1, \ldots, n\}$, the pull back $F^{*}\left(D_{J}\right)$ of the divisor class $D_{J}$ is a subvariety of $\bar{U}_{n-1}$ for which the fiber $\pi^{-1}(P)$ is a nodal curve of type given by $D_{J}$, when $P$ is its generic point. It follows that $P$ is a point of the proper transform of the subvariety $X_{I}$, where $I:=\{1, \ldots, n\}-J$, when $|J| \geqslant 3$, and belongs to the proper transform of the divisors $a_{i}, d_{j, k}$ if $J=\{i, n\},\{j, k\}$, for $1 \leqslant i \leqslant n-1$ and $1 \leqslant j<k \leqslant n-1$. But the proper transform of $X_{I}$ is equal to $E_{I}$, when $|I| \leqslant n-3$, and those of the divisors $a_{i}, d_{j, k}$ are $a_{i}-\sum_{i \notin I \subset\{1, \ldots, n-1\}} E_{I}$ and $d_{j, k}-\sum_{I \subset\{1, \ldots, n\}-\{j, k\}} E_{I}$ respectively, for $1 \leqslant i \leqslant n-1$ and $1 \leqslant j<k \leqslant n-1$. This means that

$$
\begin{aligned}
F^{*}\left(D_{\{i, n\}}\right) & =a_{i}-\sum_{i \notin I \subset\{1, \ldots, n-1\}} E_{I} \text { for } 1 \leqslant i \leqslant n-1, \\
F^{*}\left(D_{\{j, k\}}\right) & =d_{j, k}-\sum_{I \subset\{1, \ldots, n\}-\{j, k\}} E_{I} \text { for } 1 \leqslant j<k \leqslant n-1, \\
F^{*}\left(D_{J}\right) & =E_{I}, \quad \text { where } I=\{1, \ldots, n\}-J \text { for }|J| \geqslant 3 .
\end{aligned}
$$

From this we see that the pull-back homomorphism $F^{*}$ sends tautological classes to tautological classes, and defines a ring homomorphism

$$
F^{*}: R^{*}\left(M_{1, n}^{c t}\right) \rightarrow R^{*}\left(\bar{U}_{n-1}\right)
$$

If we rewrite the expressions above, we get that

$$
\begin{aligned}
a_{i} & =F^{*}\left(\sum_{i, n \in J} D_{J}\right) \text { for } 1 \leqslant i \leqslant n-1, \\
d_{i, j} & =F^{*}\left(\sum_{j, k \in J} D_{J}\right) \text { for } 1 \leqslant j<k \leqslant n-1, \\
E_{I} & =F^{*}\left(D_{J}\right), \quad \text { where } J=\{1, \ldots, n\}-I \text { for }|I| \leqslant n-3 .
\end{aligned}
$$

This shows that $F^{*}$ is a surjection. We prove that $F^{*}$ is injective by extending the function

$$
\begin{aligned}
& G:\left\{a_{i}, d_{j, k}, E_{I}: 1 \leqslant i \leqslant n-1,1 \leqslant j<k \leqslant n-1, I \subset\{1, \ldots, n\}\right. \\
&\text { and }|I| \leqslant n-3\} \rightarrow R^{*}\left(M_{1, n}^{c t}\right)
\end{aligned}
$$

defined by the rule

$$
\begin{aligned}
G\left(a_{i}\right) & =\sum_{i, n \in J} D_{J} \text { for } 1 \leqslant i \leqslant n-1, \\
G\left(d_{j, k}\right) & =\sum_{j, k \in J} D_{J} \text { for } 1 \leqslant i \leqslant n-1 \text { and } 1 \leqslant j<k \leqslant n-1, \\
G\left(E_{I}\right) & =D_{I^{c}} \text { for }|I| \leqslant n-3
\end{aligned}
$$

to a ring homomorphism

$$
G: R^{*}\left(\bar{U}_{n-1}\right) \rightarrow R^{*}\left(M_{1, n}^{c t}\right)
$$

This is done by verifying that all relations between elements $a_{i}, d_{j, k}, E_{I}$ 's on the left hand side hold between classes on the right hand side. To simplify the notation, we drop the letter $G$ for tautological classes in $R^{*}\left(M_{1, n}^{c t}\right)$. For instance, we write $a_{i}=\sum_{i, n \in J} D_{J}$ and $E_{I}=D_{I^{c}}$ for a subset $I \subset$ $\{1, \ldots, n\}$ with $|I| \leqslant n-3$.

Let us introduce the following notation: Suppose $S$ is a subset of the set $\{1, \ldots, n\}$. By $M_{1, S}^{c t}$, we mean the moduli space of stable curves of genus one of compact type whose marking set is $S$. Let

$$
\pi_{S}: M_{1, n}^{c t} \rightarrow M_{1, S}^{c t}
$$

be the projection which forgets the markings in $\{1, \ldots, n\}-S$ and contracts unstable components.

- We first deal with relations among generators of $R^{*}\left(C^{n-1}\right)$ : Notice that

$$
\begin{aligned}
a_{i} & =\pi_{\{i, n\}}^{*}\left(D_{\{i, n\}}\right), \quad d_{j, k}=\pi_{\{j, k\}}^{*}\left(D_{\{j, k\}}\right) \\
b_{j, k} & =\pi_{\{j, k, n\}}^{*}\left(D_{\{j, k\}}-D_{\{j, n\}}-D_{\{k, n\}}-D_{\{j, k, n\}}\right)
\end{aligned}
$$

From the relations $D_{\{i, n\}}^{2}=D_{\{j, k\}}^{2}=0$ in $R^{2}\left(M_{1,\{i, n\}}^{c t}\right)$ and $R^{2}\left(M_{1,\{j, k\}}^{c t}\right)$, we obtain that the relations $a_{i}^{2}=d_{j, k}^{2}=0$ hold in $R^{2}\left(M_{1, n}^{c t}\right)$, for $1 \leqslant i \leqslant n-1$ and $1 \leqslant j<k \leqslant n-1$. On the other hand, the relation

$$
\begin{aligned}
\left(D_{\{i, j\}}-D_{\{i, n\}}-D_{\{j, n\}}-D_{\{i, j, n\}}\right) \cdot & \left(D_{\{i, n\}}+D_{\{i, j, n\}}\right) \\
& =0 \in R^{2}\left(M_{1,\{i, j, n\}}^{c t}\right)
\end{aligned}
$$

says that $a_{i} b_{i, j}=0$. From the relation $d_{j, k}^{2}=0$ obtained above, we get that $b_{j, k}^{2}=-2 a_{j} a_{k}$. Now suppose that $i, j, k, l$ are distinct elements of the set $\{1, \ldots, n-1\}$. As we saw in the fourth section, the relation (1) in $R^{2}\left(M_{1,\{i, j, k, n\}}^{c t}\right)$ can be written as

$$
12\left(a_{i} b_{j, k}-b_{i, j} b_{i, k}\right)=0
$$

The relation

$$
12\left(b_{i, j} b_{k, l}+b_{i, k} b_{j, l}+b_{i, l} b_{j, k}\right)=0
$$

is the pull-back of the relation above to $R^{2}\left(M_{1,\{i, j, k, l, n\}}^{c t}\right)$ along the morphism

$$
\pi_{\{i, j, k, n\}}: M_{1,\{i, j, k, l, n\}}^{c t} \rightarrow M_{1,\{i, j, k, n\}}^{c t}
$$

This shows that the classes $a_{i}, b_{j, k} \in R^{*}\left(M_{1, n}^{c t}\right)$ satisfy all relations among $a_{i}, b_{j, k} \in R^{*}\left(\bar{U}_{n-1}\right)$.

- Note that the following

$$
D_{I} \cdot D_{J} \neq 0 \Rightarrow I \subseteq J \quad \text { or } J \subseteq I \quad \text { or } I \cap J=\emptyset
$$

is true. But this can be written as

$$
E_{I} \cdot E_{J} \neq 0 \Rightarrow I \subseteq J \quad \text { or } J \subseteq I \quad \text { or } I \cup J=\{1, \ldots, n\} .
$$

This proves that the $E_{I}$ 's in $R^{*}\left(M_{1, n}^{c t}\right)$ satisfy this class of relations between $E_{I}$ 's in $R^{*}\left(\bar{U}_{n-1}\right)$ obtained above.

- For any $I \subset\{1, \ldots, n\}$ with $|I| \leqslant n-3$, we found the relations $x . E_{I}=0$ for $x \in \operatorname{ker}\left(i_{I}^{*}\right)$, where $i_{I}: X_{I} \rightarrow C^{n-1}$ denotes the inclusion. If $n \notin I$, then $\operatorname{ker}\left(i_{I}^{*}\right)$ is generated by divisor classes $a_{i}, b_{i, j}$, where $i \in J:=\{1, \ldots, n-1\}-I$, and $j \in\{1, \ldots, n-1\}$ is different from $i$. Let us see that $a_{i} \cdot E_{I}=0$ in this case:

$$
a_{i} \cdot E_{I}=D_{J}^{2}+\sum_{J_{0}: i, n \in J_{0} \subset J} D_{J_{0}} \cdot D_{J}+\sum_{J_{0}: i, n \in J_{0}, J \subset J_{0}} D_{J_{0}} \cdot D_{J} .
$$

But this expression is zero from the following known formula for $\psi$ classes in genus zero and one:

Proposition 6.1.
(a) The following relation holds in $A^{1}\left(\bar{M}_{0, n}\right)$ :

$$
\psi_{i}=\sum_{j, k \notin J, i \in J,|J| \geqslant 2} D_{J}
$$

for some fixed distinct $j, k \in\{1, \ldots, n\}-\{i\}$.
(b) The following relation holds in $A^{1}\left(M_{1, n}^{c t}\right)$ :

$$
\psi_{i}=\sum_{i \in J,|J| \geqslant 2} D_{J} .
$$

Proof.
(a) is Proposition 1.6 in [1].

To prove (b), it is enough to restrict the divisor classes given in Proposition 1.9 of [1], to the space $M_{1, n}^{c t}$.

If $i \in\{1, \ldots, n-1\}-I$, and $j \in\{1, \ldots, n-1\}$ is distinct from $i$, we saw that $a_{i} \cdot E_{I}=0$, and by the same argument as above we see that $a_{j} \cdot E_{I}=d_{i, j} \cdot E_{J}$, from which it follows that

$$
b_{i, j} \cdot E_{I}=\left(d_{i, j}-a_{i}-a_{j}\right) \cdot E_{I}=0
$$

The case $n \in I$ is proven by the same argument.

- We get a relation $P_{W / Y}\left(-E_{Z}\right) \cdot E_{V_{1}} \cdots E_{V_{k}}=0$, when the subvariety $Z$ is a transversal intersection $V_{1} \cap \cdots \cap V_{k} \cap W$. After possibly relabeling the indices, we can assume that

$$
\begin{aligned}
Z & =X_{I_{0}}, \quad V_{i}=X_{I_{i}}, \text { for } 1 \leqslant i \leqslant k, \\
W & =\prod_{i=r_{0}+1}^{r_{1}} a_{i} \cdot \prod_{j=1}^{k-1} a_{r_{j}+1},
\end{aligned}
$$

where $r_{0} \leqslant r_{1}<\cdots<r_{k}<n$, and $I_{0}=\left\{1, \ldots, r_{0}\right\}, I_{i}^{c}=\left\{r_{i}+\right.$ $\left.1, \ldots, r_{i+1}\right\}$, for $1 \leqslant i<k$, and $I_{k}^{c}=\left\{r_{k}+1, \ldots, n\right\}$. Let us prove that

$$
P_{W / C^{n-1}}\left(-\sum_{J \subseteq I_{0}} E_{I}\right) \cdot E_{I_{1}} \cdots E_{I_{k}}=0 \in R^{r_{1}-r_{0}+2 k-1}\left(M_{1, n}^{c t}\right)
$$

by showing that any monomial in the expansion of this expression is zero. Let

$$
\prod_{i=r_{0}+1}^{r_{1}} E_{J_{i}} \cdot \prod_{j=1}^{k-1} E_{J_{r_{j}+1}} \cdot E_{I_{1}} \cdots E_{I_{k}}
$$

where

$$
i, n \in J_{i}^{c} \text { for } r_{0}+1 \leqslant i \leqslant r_{1}, \text { and } r_{j}+1, n \in J_{j}^{c} \text { for } 1 \leqslant j \leqslant k-1
$$

be any such monomial.
For $r_{0}+1 \leqslant i \leqslant r_{1}$, if the product $E_{J_{i}} \cdot E_{I_{k}}$ is non-zero, then $J_{i} \subseteq I_{k}-\{i\}$. For $1 \leqslant j \leqslant k-1$, if the product $E_{J_{r_{j}+1}} \cdot E_{I_{j}}$ is non-zero, then $J_{r_{j}+1} \subseteq I_{j}$. On the other hand, since $n \notin J_{i}, J_{r_{j}+1}$ for all $i, j$, the product $E_{J_{i_{1}}} \cdot E_{J_{i_{2}}}$ is non-zero only if $J_{i_{1}} \subseteq J_{i_{2}}$ or
$J_{i_{2}} \subseteq J_{i_{1}}$. It follows that the subsets $J_{i}$ 's are totally ordered by inclusion, which means that their intersection is one of them. We conclude that for some $i$ the inclusion $J_{i} \subseteq I_{0}$ holds. But this term is excluded from expression above, whence the product is zero.

- For any subset $I \subset\{1, \ldots, n\}$, where $|I| \leqslant n-3$, we prove that $P_{X_{I} / C^{n-1}}\left(-\sum_{J \subseteq I} E_{J}\right)$ is zero by the same argument as in the previous case, by showing that the monomials occurring in the expansion of the expression above are all zero.
The argument above shows that $F^{*}$ is an isomorphism, and hence, our proof of Theorem 0.1 is complete.

## Appendix: Derivation of the relations (2) and (3)

In this appendix we explain why the relations (2) and (3) follow from Getzler's relation (1). First note that the restriction of the relation (1) to the space $M_{1,4}^{c t}$ becomes

$$
\begin{equation*}
12 \delta_{2,2}-4 \delta_{2,3}-2 \delta_{2,4}+6 \delta_{3,4}=0 \tag{6}
\end{equation*}
$$

Then we compute the pull-back of the classes above to the space $\bar{U}_{3}$ along the morphism

$$
F: \bar{U}_{3} \rightarrow M_{1,4}^{c t}
$$

Recall that

$$
\begin{aligned}
\delta_{2,2}= & D_{\{1,2\}} \cdot D_{\{3,4\}}+D_{\{1,3\}} \cdot D_{\{2,4\}}+D_{\{1,4\}} \cdot D_{\{2,3\}}, \\
\delta_{2,3}= & D_{\{1,2\}} \cdot D_{\{1,2,3\}}+D_{\{1,2\}} \cdot D_{\{1,2,4\}}+D_{\{1,3\}} \cdot D_{\{1,2,3\}} \\
& +D_{\{1,3\}} \cdot D_{\{1,3,4\}}+D_{\{1,4\}} \cdot D_{\{1,2,4\}}+D_{\{1,4\}} \cdot D_{\{1,3,4\}} \\
& +D_{\{2,3\}} \cdot D_{\{1,2,3\}}+D_{\{2,3\}} \cdot D_{\{2,3,4\}}+D_{\{2,4\}} \cdot D_{\{1,2,4\}} \\
& +D_{\{2,4\}} \cdot D_{\{2,3,4\}}+D_{\{3,4\}} \cdot D_{\{1,3,4\}}+D_{\{3,4\}} \cdot D_{\{2,3,4\}}, \\
\delta_{2,4}= & D_{\{1,2\}} \cdot D_{\{1,2,3,4\}}+D_{\{1,3\}} \cdot D_{\{1,2,3,4\}}+D_{\{1,4\}} \cdot D_{\{1,2,3,4\}} \\
& +D_{\{2,3\}} \cdot D_{\{1,2,3,4\}}+D_{\{2,4\}} \cdot D_{\{1,2,3,4\}}+D_{\{3,4\}} \cdot D_{\{1,2,3,4\}}, \\
\delta_{3,4}= & D_{\{1,2,3\}} \cdot D_{\{1,2,3,4\}}+D_{\{1,2,4\}} \cdot D_{\{1,2,3,4\}}+D_{\{1,3,4\}} \cdot D_{\{1,2,3,4\}} \\
& +D_{\{2,3,4\}} \cdot D_{\{1,2,3,4\}} .
\end{aligned}
$$

From the argument given in Section 6 we see that

$$
\begin{aligned}
F^{*}\left(D_{I}\right) & =E_{\{1,2,3,4\}-I} \text { when }|I|=3,4, \\
F^{*}\left(D_{\{i, 4\}}\right) & =a_{i}-E_{0}-E_{j}-E_{k}, \\
F^{*}\left(D_{\{j, k\}}\right) & =d_{j, k}-E_{0}-E_{i}-E_{4},
\end{aligned}
$$

for $1 \leqslant i \leqslant 3$ and $j \neq k \in\{1,2,3\}-\{i\}$, from which we conclude that

$$
\begin{aligned}
F^{*}\left(\delta_{2,2}\right)= & a_{1} d_{2,3}+a_{2} d_{1,3}+a_{3} d_{1,2}+3 E_{0}^{2} \\
F^{*}\left(\delta_{2,3}\right)= & 3\left(a_{1} a_{2}+a_{1} a_{3}+a_{2} a_{3}+d_{1,2} d_{1,3}\right) \\
& +3\left(4 E_{0}+E_{1}+E_{2}+E_{3}+E_{4}\right) E_{0} \\
F^{*}\left(\delta_{2,4}\right)= & -3\left(2 E_{0}+E_{1}+E_{2}+E_{3}+E_{4}\right) E_{0} \\
F^{*}\left(\delta_{3,4}\right)= & \left(E_{1}+E_{2}+E_{3}+E_{4}\right) E_{0}
\end{aligned}
$$

If we substitute the expressions above into the relation (6), we get that

$$
\begin{aligned}
12\left(a_{1} d_{2,3}+a_{2} d_{1,3}+a_{3} d_{1,2}-a_{1} a_{2}-a_{1} a_{3}\right. & \left.-a_{2} a_{3}-d_{1,2} d_{1,3}\right) \\
& =12\left(a_{1} b_{2,3}-b_{1,2} b_{1,3}\right)=0
\end{aligned}
$$

The push-forward of the relation above via the blow-down map to $C^{3}$ gives the relation (2).

To get the relation (3), notice that the pull-back of the divisor class $a_{i}$, for $1 \leqslant i \leqslant 3$, via the morphism $\pi: \bar{U}_{4} \rightarrow \bar{U}_{3}$, is $d_{i, 4}$, and that of $b_{i, j}$, for $1 \leqslant i, j \leqslant 3$, is $d_{i, j}-d_{i, 4}-d_{j, 4}$. From this observation it is easy to see that the pull-back of the relation above to $R^{2}\left(\bar{U}_{4}\right)$ along the morphism $\pi$ gives a relation whose push-forward to $R^{2}\left(C^{4}\right)$ via the blow-down map is the relation (3).
