# Tableau models for semi-infinite Bruhat order and level-zero representations of quantum affine algebras 

Motohiro Ishii

#### Abstract

We prove that semi-infinite Bruhat order on an affine Weyl group is completely determined from those on the quotients by affine Weyl subgroups associated with various maximal (standard) parabolic subgroups of finite type. Furthermore, for an affine Weyl group of classical type, we give a complete classification of all cover relations of semi-infinite Bruhat order (or equivalently, all edges of the quantum Bruhat graphs) on the quotients in terms of tableaux. Combining these we obtain a tableau criterion for semi-infinite Bruhat order on an affine Weyl group of classical type. As an application, we give new tableau models for the crystal bases of a level-zero fundamental representation and a level-zero extremal weight module over a quantum affine algebra of classical untwisted type, which we call quantum KashiwaraNakashima columns and semi-infinite Kashiwara-Nakashima tableaux. We give an explicit description of the crystal isomorphisms among three different realizations of the crystal basis of a level-zero fundamental representation by quantum Lakshmibai-Seshadri paths, quantum Kashiwara-Nakashima columns, and (ordinary) Kashiwara-Nakashima columns.

## 1. Introduction

The aim of this paper is to give an explicit description of semi-infinite Bruhat order in terms of tableaux and its application to level-zero representation theory of quantum affine algebras.

Semi-infinite Bruhat order on an affine Weyl group is a variant of Bruhat order on a Coxeter group, and it is also an important tool to study representation theory of algebraic groups, quantum groups, and affine Kac-Moody Lie algebras, quantum and affine Schubert calculi, and so forth (see [2, 5, 10, 11, 19, 22, 24, 25, 20, 28, 29, 32] and the references given there). In fact, analogously to (ordinary) Bruhat order, each of the following structures is closely related (or equivalent) to semi-infinite Bruhat order: Lusztig's generic Bruhat order ( $[28, \S 1.5]$ ) and Peterson's stable Bruhat order ([32, Lecture 12]) on an affine Weyl group, Littelmann's order on the affine Weyl group orbit through a level-zero integral weight of an affine Kac-Moody Lie algebra ([27, $\S 4])$, the quantum Bruhat graphs ([5, Definition 6.1] and $[24, \S 4]$ ), homomorphisms among Wakimoto modules over an affine Kac-Moody Lie algebra ([2, Proposition $4.10]$ ), the containment relation among (opposite) Demazure subcrystals of the crystal basis of a level-zero extremal weight module over a quantum affine algebra ([29, Corollary 5.2.5]), and the containment relation among semi-infinite Schubert varieties ( $[19, \S 4.2]$ ); see also (i)-(ii) below. Also, it is worth pointing out that semi-infinite Bruhat order has the lifting property (or "diamond lemma") with respect to the semi-infinite length function ( $[11, \S 4.1]$; see also Lemma 2.6); note that Bruhat order on a Coxeter group is characterized uniquely by the lifting property with respect to the length function ([8, Theorem 1.1]; see also [4, Exercise 14 in $\S 2]$ ). However there indeed exist some differences between semi-infinite and ordinary Bruhat orders. For example, there are no minimal elements in semi-infinite Bruhat order, and this order depends on not only the Coxeter system but also the root data. Therefore the standard method to study Bruhat order (see for instance [4]) is not well adapted to the study of semi-infinite Bruhat order.

In [10], we intended to develop tableau combinatorics on semi-infinite Bruhat order. We introduced semi-infinite Young tableaux, and showed that these tableaux give a combinatorial realization of the crystal basis of a level-zero extremal weight module ( $[14,16]$ ) over the quantum affine algebra of type $A_{n-1}^{(1)}$. Our proof of this result was based on a tableau criterion for semi-infinite Bruhat order and standard monomial theory for semi-infinite Lakshmibai-Seshadri paths ([11, §3.1]). Therefore we can think of these tableaux as a natural generalization of (ordinary) Young tableaux. However we restricted the discussion in $[10, \S 4]$ only to the affine Weyl group of type $A_{n-1}^{(1)}$, and
the tableau criterion in [10, Theorem 4.7] is applicable only to semi-infinite Bruhat order on the quotient by an affine Weyl subgroup associated with a maximal parabolic subgroup of finite type.

In this paper, we wish to investigate semi-infinite Bruhat order on an affine Weyl group of all classical untwisted type via tableaux, and aim to give an application to level-zero representation theory (see for instance $[1,3,16,17]$ ) of a quantum affine algebra of classical untwisted type. The main results of this paper are the following (see Theorems 3.1, 4.9, 4.14, 4.22, 4.38, 5.13, 5.16, 5.18, 5.21, and 5.23):
(I) a Deodhar-type criterion for semi-infinite Bruhat order on an affine Weyl group of arbitrary untwisted type,
(II) a tableau criterion for semi-infinite Bruhat order on an affine Weyl group of type $A_{n-1}^{(1)}, B_{n}^{(1)}, C_{n}^{(1)}$, and $D_{n}^{(1)}$ in full generality,
(III) a tableau model for the crystal basis of a level-zero fundamental representation (resp. a level-zero extremal weight module) over a quantum affine algebra of type $B_{n}^{(1)}$ and $D_{n}^{(1)}$ (resp. $B_{n}^{(1)}, C_{n}^{(1)}$, and $D_{n}^{(1)}$ ), which we call quantum Kashiwara-Nakashima columns (resp. semi-infinite Kashiwara-Nakashima tableaux), and
(IV) an explicit description of the isomorphisms among three different realizations of the crystal basis of a level-zero fundamental representation by quantum Lakshmibai-Seshadri paths ([25]), quantum Kashiwara-Nakashima columns, and (ordinary) Kashiwara-Nakashima columns ([18]).
Let us give more precise explanation of our results. Let $\mathbf{U}$ be a quantum affine algebra of untwisted type, and let $\mathbf{U}^{\prime}$ be its derived subalgebra. Let $W_{\text {af }}=\left\langle r_{i} \mid i \in I_{\text {af }}\right\rangle$ be the affine Weyl group associated with a finite Weyl group $W=\left\langle r_{i} \mid i \in I\right\rangle$, where $I_{\mathrm{af}}=\{0\} \sqcup I$ and $r_{i}, i \in I_{\mathrm{af}}$, is a simple reflection. For $J \subset I$, let $W_{J}=\left\langle r_{j}\right|$ $j \in J\rangle \subset W$ be a (standard) parabolic subgroup, and let $W^{J} \subset W$ be the set of minimal(-length) coset representatives for $W / W_{J}$. Let $\left(W_{J}\right)_{\text {af }} \subset W_{\text {af }}$ be the affine Weyl subgroup associated with $W_{J}$ (see (19)). Note that $\left(W_{J}\right)_{\text {af }}$ is not a parabolic subgroup of $W_{\text {af }}$, but it is generated by reflections. Therefore there exists the subset $\left(W^{J}\right)_{\text {af }} \subset W_{\text {af }}$ of minimal coset representatives for $W_{\text {af }} /\left(W_{J}\right)_{\text {af }}$ (see (20)); note that if $J=\varnothing$, then $\left(W_{J}\right)_{\text {af }}$ is trivial and $\left(W^{J}\right)_{\text {af }}=W_{\text {af }}$. Let $\Pi^{J}: W_{\text {af }} \rightarrow\left(W^{J}\right)_{\text {af }}$ be the canonical surjection. In this paper, following [11, §2.4] (see also [32, Lecture 12]), we define semi-infinite Bruhat order $\preceq$ on $\left(W^{J}\right)_{\text {af }}$ by using the semi-infinite length function $\ell^{\frac{\infty}{2}}: W_{\mathrm{af}} \rightarrow \mathbb{Z}$ (see (21)). But we mainly use the following two realizations of semi-infinite Bruhat order (see Lemmas 3.7 (3) and 4.3 for precise formulation):
(i) the containment relation among the path model $\mathbb{B}_{\succeq x}^{\frac{\infty}{2}}(\lambda), x \in W_{\text {af }}$, of the (opposite) Demazure subcrystals of the crystal basis of the extremal weight U-module of level-zero extremal weight $\lambda([29, \S 5])$,
(ii) the "affinization" of the (parabolic) quantum Bruhat graph $\mathrm{QB}^{J}$ for $W^{J}$ ([11, Appendix A]).
In §3, we prove a Deodhar-type criterion for semi-infinite Bruhat order (see (I) above), which states that for $x, y \in\left(W^{J}\right)_{\text {af }}$ we have $x \preceq y$ in $\left(W^{J}\right)_{\text {af }}$ if and only if

$$
\begin{equation*}
\Pi^{I \backslash\{i\}}(x) \preceq \Pi^{I \backslash\{i\}}(y) \text { in }\left(W^{I \backslash\{i\}}\right)_{\mathrm{af}} \text { for all } i \in I \backslash J \tag{1}
\end{equation*}
$$

(cf. [4, Theorem 2.6.1]; see also [8, Lemma 3.6]). We prove this for $W_{\text {af }}$ of arbitrary untwisted type (see Theorem 3.1 and Proposition 3.2). This is shown by investigating the path model $\mathbb{B}_{\succeq x}^{\frac{\infty}{2}}(\lambda), x \in W_{\text {af }}$, of Demazure subcrystals. More precisely, let $\varpi_{i}, i \in I$, be a level-zero fundamental weight, and let $\lambda=\sum_{i \in I} m_{i} \varpi_{i}, m_{i} \in \mathbb{Z}_{\geqslant 0}, i \in I$. Set $J_{\lambda}=$
$\left\{i \in I \mid m_{i}=0\right\}$. The path model $\mathbb{B}_{\succeq x}^{\frac{\infty}{2}}(\lambda), x \in W_{\mathrm{af}}$, is defined as a subset of the $\mathbf{U}$ crystal $\mathbb{B}^{\frac{\infty}{2}}(\lambda)$ of semi-infinite Lakshmibai-Seshadri paths of shape $\lambda$. We prove that any extremal element in the tensor product $\bigotimes_{i \in I \backslash J_{\lambda}} \mathbb{B}_{\succeq \Pi^{\prime \backslash\{i\}}(x)}^{\frac{\infty}{2}}\left(m_{i} \varpi_{i}\right)$ (see (46)) is in the image of $\mathbb{B}_{\succeq x}^{\frac{\infty}{2}}(\lambda)$ under the isomorphism $\psi_{\lambda}: \mathbb{B}^{\frac{\infty}{2}}(\lambda) \rightarrow \bigotimes_{i \in I \backslash J_{\lambda}} \mathbb{B}^{\frac{\infty}{2}}\left(m_{i} \varpi_{i}\right)$ of U-crystals (see Lemma 3.3 and Proposition 3.4 (2)). In $\S 3.3$, we see that this immediately yields the Deodhar-type criterion.

In $\S 4$, for $W_{\text {af }}$ of type $A_{n-1}^{(1)}, B_{n}^{(1)}, C_{n}^{(1)}$, and $D_{n}^{(1)}$, we give a complete classification of the cover relations of semi-infinite Bruhat order on $\left(W^{I \backslash\{i\}}\right)_{\mathrm{af}}, i \in I$, in terms of tableaux (Propositions 4.19, 4.27, and 4.43; see also [10, Proposition 4.11]). Moreover, we prove a tableau criterion for semi-infinite Bruhat order on $\left(W^{I \backslash\{i\}}\right)_{\mathrm{af}}, i \in I$ (Definitions 4.7, 4.12, 4.20, and 4.36, and Propositions 4.8, 4.13, 4.21, and 4.37; see also [10, Theorem 4.7]). Combining this with the Deodhar-type criterion we obtain (II). We emphasize that (II) can be thought of as a generalization of the tableau criterion for Bruhat order on the symmetric group ([4, Theorem 2.6.3 (Tableau Criterion)]). Our main tool in $\S 4$ is the quantum Bruhat graph. In fact, we classify all (quantum) edges in the quantum Bruhat graph $\mathrm{QB}^{I \backslash\{i\}}$ for $W^{I \backslash\{i\}}, i \in I$ (Propositions 4.18, 4.26, and 4.42; see also [10, Lemma 4.15]). Combining this with the realization (ii) yields the classification results above. We should remark that, for $W_{\text {af }}$ of type $A_{n-1}^{(1)}$ and $C_{n}^{(1)}$, Lenart's criterion ([22, Propositions 3.6 and 5.7$]$ ) for the edges of the quantum Bruhat graph $\mathrm{QB}^{\varnothing}$ for $W$ is a necessary condition for our classification results. Indeed, the existence of an edge in $\mathrm{QB}^{I \backslash\{i\}}$ implies that in $\mathrm{QB}^{\varnothing}$ (see Lemma 4.4 for a precise statement).

We now briefly sketch the tableau criterion for semi-infinite Bruhat order on $\left(W^{I \backslash\{i\}}\right)_{\text {af }}$ when $W_{\text {af }}$ is of type $A_{n-1}^{(1)}(\S 4.3$ and $[10, \S 4]$; see also Example 4.10). First, we associate each element of $W_{\text {af }}$ with a pair ( $\mathrm{T}, c$ ) of a column T of length $i$ and an integer $c$ (see (65)). Let $\mathrm{T}(u) \in\{1,2, \ldots, n\}$ denote the $u$-th entry of T. Let (T, $c),\left(\mathrm{T}^{\prime}, c^{\prime}\right)$ be such pairs for $x, y \in W_{\text {af }}$, respectively. Then we have $\Pi^{I \backslash\{i\}}(x) \preceq \Pi^{I \backslash\{i\}}(y)$ in $\left(W^{I \backslash\{i\}}\right)_{\text {af }}$ if and only if

$$
\begin{equation*}
\left(c \leqslant c^{\prime}\right) \text { and }\left(\mathbf{T}(u) \leqslant \mathrm{T}^{\prime}\left(u+c^{\prime}-c\right) \text { for } 1 \leqslant u \leqslant i-c^{\prime}+c\right) . \tag{2}
\end{equation*}
$$

In §5, we prove (III)-(IV). For this purpose, we first investigate the subgraph $\mathrm{QB}\left(\varpi_{i} ; 1 / 2\right)$ (see $\S 5.1-\S 5.2$ ) of the quantum Bruhat graph $\mathrm{QB}^{I \backslash\{i\}}$, where the vertex sets of these graphs are both $W^{I \backslash\{i\}}$. We see that $\mathrm{QB}\left(\varpi_{i} ; 1 / 2\right)$ defines a partial order $\unlhd$ on $W^{I \backslash\{i\}}$. Moreover, by the classification results in $\S 4$, we obtain an explicit description of the order $\unlhd$ in terms of Maya diagrams (see Definitions 5.4 and 5.6). Then the $\mathbf{U}^{\prime}$-crystal QLS $\left(\varpi_{i}\right)$ of quantum Lakshmibai-Seshadri paths (QLS paths for short) of shape $\varpi_{i}$ is given by

$$
\begin{equation*}
\operatorname{QLS}\left(\varpi_{i}\right)=\left\{(v, w) \mid w, v \in W^{I \backslash\{i\}}, w \unlhd v\right\} \tag{3}
\end{equation*}
$$

It is well-known that $W^{I \backslash\{i\}}$ can be realized as a set of columns (see Lemmas 4.6, 4.11, and 4.35). Thus we can think of each QLS path $(v, w) \in \operatorname{QLS}\left(\varpi_{i}\right)$ as a pair of columns. We know from [25] that $\operatorname{QLS}\left(\varpi_{i}\right)$ is isomorphic, as a $\mathbf{U}^{\prime}$-crystal, to the crystal basis of the level-zero fundamental representation $W\left(\varpi_{i}\right)$ ([16, 17]; see also $\S 2.4$ and $\S 5.1$ ).

Assume that $\mathbf{U}$ is of type $B_{n}^{(1)}$. In $\S 5.4$, we introduce quantum KashiwaraNakashima $B_{n}$-columns (QKN $B_{n}$-columns for short) and a $\mathbf{U}^{\prime}$-crystal structure on them. In particular, we define Kashiwara operators $e_{j}, f_{j}, j \in I_{\mathrm{af}}$, acting on them. A QKN $B_{n}$-column $\tilde{\mathrm{C}}$ of shape $\varpi_{i}$ is consisting of an (ordinary) Kashiwara-Nakashima
$B_{n}$-column (KN $B_{n}$-column for short) C of shape $\varpi_{i-2 m}$ and a multiset $\{\underbrace{\overline{0}, \overline{0}, \ldots, \overline{0}}_{2 m \text { times }}\}$ for some integer $0 \leqslant m \leqslant\left\lfloor\frac{i}{2}\right\rfloor=\max \{k \in \mathbb{Z} \mid k \leqslant i / 2\}$; we write $\tilde{\mathrm{C}}=\mathrm{C} \cup\{\underbrace{\overline{0}, \overline{0}, \ldots, \overline{0}}_{2 m \text { times }}\}$ for brevity. Let $\mathrm{QKN}_{B_{n}}\left(\varpi_{i}\right)$ (resp. $\mathrm{KN}_{B_{n}}\left(\varpi_{i}\right)$ ) denote the set of QKN $B_{n}$-columns (resp. KN $B_{n}$-columns) of shape $\varpi_{i}$. Let us give an example of a QKN $B_{n}$-column. We have

$$
\tilde{\mathrm{C}}=\begin{array}{|c|}
\hline 2  \tag{4}\\
\hline 3 \\
\hline 0 \\
\hline \overline{9} \\
\hline \overline{3} \\
\hline \overline{0} \\
\hline \overline{0} \\
\hline
\end{array}=\mathrm{C} \cup\{\overline{0}, \overline{0}\} \in \operatorname{QKN}_{B_{9}}\left(\varpi_{7}\right) \quad \text { and } \mathrm{C}=\begin{array}{|c|}
\hline 2 \\
\hline 3 \\
\hline 0 \\
\hline \overline{9} \\
\hline \overline{3} \\
\hline
\end{array} \in \mathrm{KN}_{B_{9}( }\left(\varpi_{5}\right) .
$$

For each QKN $B_{n}$-column $\tilde{C}$ of shape $\varpi_{i}$, we construct a pair ( $\left.r \tilde{\mathrm{C}}, l \tilde{\mathrm{C}}\right)$ of columns, and show that it is a QLS path of shape $\varpi_{i}$. The construction of $(r \tilde{\mathrm{C}}, l \tilde{\mathrm{C}})$ was motivated by $[34, \S 4]$ (see also $[21, \S 3]$ ), and has previously been used by Briggs ( $[6]$; see also [26, Algorithm 4.1]). For the QKN $B_{n}$-column $\tilde{C}$ in (4), we have

$$
r \tilde{\mathrm{C}}=\begin{array}{|c|}
\hline 2  \tag{5}\\
\hline 3 \\
\hline 4 \\
\hline 5 \\
\hline \overline{9} \\
\hline \overline{8} \\
\hline \overline{1} \\
\hline
\end{array} \quad \text { and } \quad l \tilde{\mathrm{C}}=\begin{array}{|c|}
\hline 1 \\
\hline 2 \\
\hline \overline{8} \\
\hline \overline{9} \\
\hline \overline{5} \\
\hline \overline{4} \\
\hline \overline{3} \\
\hline
\end{array}
$$

by using notation in $\S 5.2$, $\S 5.4$, and $\S 5.6$, we have
(1) $I_{\mathrm{C}}=\{0 \succeq 3\}, J_{\mathrm{C}}=\{8>1\}, K_{\tilde{\mathrm{C}}}=\{4<5\}$,
(2) $\mathcal{J}(r \tilde{\mathrm{C}})=\mathcal{J}(l \tilde{\mathrm{C}})=(\{1,2,3,4,5\}<\{8,9\}) \in \mathcal{S}_{7}$, and
(3) $\mathcal{M}(r \tilde{\mathrm{C}})=(\{1\},\{8,9\}), \mathcal{M}(l \tilde{\mathrm{C}})=(\{3,4,5\},\{9\}) \in 2^{\{1,2,3,4,5\}} \times 2^{\{8,9\}}$.

Then we prove that the map $\operatorname{QKN}_{B_{n}}\left(\varpi_{i}\right) \rightarrow \operatorname{QLS}\left(\varpi_{i}\right), \tilde{\mathrm{C}} \mapsto(r \tilde{\mathrm{C}}, l \tilde{\mathrm{C}})$, is bijective. The important point to note here is that the inverse of this map can be described explicitly in terms of Maya diagrams (see Theorem 5.16 (2)); similar results have been obtained independently by Lenart-Schulze $([26, \S 4])$, where they used the quantum alcove model ([23]). Thus we obtain the following crystal isomorphisms among the sets of QLS paths, QKN $B_{n}$-columns, and KN $B_{n}$-columns (cf. [7, Lemma 2.7]).

$$
\begin{equation*}
\operatorname{QLS}\left(\varpi_{i}\right) \leftrightarrow \operatorname{QKN}_{B_{n}}\left(\varpi_{i}\right) \leftrightarrow \bigsqcup_{m=0}^{\left\lfloor\frac{i}{2}\right\rfloor} \mathrm{KN}_{B_{n}}\left(\varpi_{i-2 m}\right) \tag{6}
\end{equation*}
$$

$$
(r \tilde{\mathrm{C}}, l \tilde{\mathrm{C}}) \leftrightarrow \tilde{\mathrm{C}}=\mathrm{C} \cup\{\underbrace{\overline{0}, \overline{0}, \ldots, \overline{0}}_{2 m \text { times }}\} \leftrightarrow \mathrm{C} .
$$

Consequently, the $\mathbf{U}^{\prime}$-crystal $\mathrm{QKN}_{B_{n}}\left(\varpi_{i}\right)$ is isomorphic to the crystal basis of the level-zero fundamental representation $W\left(\varpi_{i}\right)$. Similar formulation and results also hold for $\mathbf{U}$ of type $D_{n}^{(1)}$ (see $\left.\S 5.5\right)$. We should remark that the crystal basis of $W\left(\varpi_{i}\right)$ is
isomorphic to the Kirillov-Reshetikhin crystal $B^{i, 1}$, and that there is another tableau model, called Kirillov-Reshetikhin tableaux ([30,33]), more generally for the KirillovReshetikhin crystals $B^{r, s}$ (see [9, §2.3]), $r \in I, s>0$, of non-exceptional type. The advantage of using QKN columns lies in the explicit description of the isomorphisms (6). Likewise, the Kirillov-Reshetikhin tableaux model is an important ingredient to describe the rigged configuration bijections (see for instance [31]). It would be desirable to relate these two tableau models but we will not develop this point here.

Assume that $\mathbf{U}$ is of type $B_{n}^{(1)}, C_{n}^{(1)}$, or $D_{n}^{(1)}$. In $\S 5.3-\S 5.5$, we introduce semiinfinite Kashiwara-Nakashima tableaux (semi-infinite KN tableaux for short), and show that the set of these tableaux is isomorphic, as a U-crystal, to the crystal basis of a level-zero extremal weight U-module. This is achieved by applying standard monomial theory for semi-infinite Lakshmibai-Seshadri paths ([10, Theorem 3.4]) to the affinizations of $\mathbf{U}^{\prime}$-crystals of $(\mathrm{Q}) \mathrm{KN}$ columns. The definition of semi-infinite KN tableaux is based on the tableau criterion for semi-infinite Bruhat order obtained in §4.

This paper is organized as follows. In §2, we set up notation and terminology on untwisted affine root data, crystals, semi-infinite Bruhat order, extremal weight modules, and semi-infinite Lakshmibai-Seshadri paths. Also, we have compiled some basic facts on these. In §3, we prove a Deodhar-type criterion for semi-infinite Bruhat order on $W_{\text {af }}$ of arbitrary untwisted type. In $\S 4$, we prove a tableau criterion for semiinfinite Bruhat order on $W_{\text {af }}$ of type $A_{n-1}^{(1)}, B_{n}^{(1)}, C_{n}^{(1)}$, and $D_{n}^{(1)}$, by classifying all cover relations of semi-infinite Bruhat order on $\left(W^{I \backslash\{i\}}\right)_{\text {af }}$ in terms of tableaux. In §5, we introduce the $\mathbf{U}^{\prime}$-crystal of QKN columns and the $\mathbf{U}$-crystal of semi-infinite KN tableaux. We show that these tableaux give combinatorial models for crystal bases of level-zero fundamental representations and level-zero extremal weight modules. We give an explicit description of the crystal isomorphisms among QLS paths, QKN columns, and KN columns.

Notation. Let $\mathbb{Z}_{>0}\left(\right.$ resp. $\left.\mathbb{Z}_{\geqslant 0}\right)$ denote the set of positive integers (resp. non-negative integers). For $k \in \mathbb{Z}$, set $[k]=\{1,2, \ldots, k\}$ if $k \geqslant 1$, and set $[k]=\varnothing$ if $k \leqslant 0$. For integers $k \leqslant l$, set $[k, l]=\{k, k+1, \ldots, l\}$; we understand that $[k, l]=\varnothing$ if $k>l$. The disjoint union of two sets $A, B$ will be denoted by $A \sqcup B$. For a (non-empty) set $A$, let $\mathfrak{S}(A)$ be the permutation group of $A$. For a finite set $A$, let $\# A$ denote the number of elements in $A$.

## 2. Preliminaries

2.1. Untwisted affine root data. Let $\mathfrak{g}_{\mathrm{af}}$ be an untwisted affine Kac-Moody Lie algebra over $\mathbb{C}$ with a Cartan subalgebra $\mathfrak{h}_{\text {af }}$. Let $\left\{\alpha_{i}\right\}_{i \in I_{\mathrm{af}}} \subset \mathfrak{h}_{\mathrm{af}}^{*}=\operatorname{Hom}_{\mathbb{C}}\left(\mathfrak{h}_{\mathrm{af}}, \mathbb{C}\right)$ and $\left\{\alpha_{i}^{\vee}\right\}_{i \in I_{\mathrm{af}}} \subset \mathfrak{h}_{\mathrm{af}}$ be the sets of simple roots and simple coroots, respectively. Here $I_{\mathrm{af}}$ denotes the vertex set of the (affine) Dynkin diagram of $\mathfrak{g}_{\text {af }}$. Let $\langle\cdot, \cdot\rangle: \mathfrak{h}_{\mathrm{af}} \times \mathfrak{h}_{\text {af }}^{*} \rightarrow \mathbb{C}$ be the canonical pairing. We take and fix an integral weight lattice $P_{\mathrm{af}} \subset \mathfrak{h}_{\mathrm{af}}^{*}$ satisfying the conditions that $\alpha_{i} \in P_{\mathrm{af}}$ and $\alpha_{i}^{\vee} \in \operatorname{Hom}_{\mathbb{Z}}\left(P_{\mathrm{af}}, \mathbb{Z}\right)$ for all $i \in I_{\mathrm{af}}$, and for each $i \in I_{\mathrm{af}}$ there exists $\Lambda_{i} \in P_{\mathrm{af}}$ such that $\left\langle\alpha_{j}^{\vee}, \Lambda_{i}\right\rangle=\delta_{i j}$ for all $j \in I_{\mathrm{af}}$. Similarly, let $P_{\mathrm{af}}^{\vee} \subset \mathfrak{h}_{\mathrm{af}}$ be an integral coweight lattice such that $\alpha_{i}^{\vee} \in P_{\mathrm{af}}^{\vee}$ and $\alpha_{i} \in \operatorname{Hom}_{\mathbb{Z}}\left(P_{\mathrm{af}}^{\vee}, \mathbb{Z}\right)$ for all $i \in I_{\mathrm{af}}$, and for each $i \in I_{\mathrm{af}}$ there exists $\Lambda_{i}^{\vee} \in P_{\mathrm{af}}^{\vee}$ such that $\left\langle\Lambda_{i}^{\vee}, \alpha_{j}\right\rangle=\delta_{i j}$ for all $j \in I_{\mathrm{af}}$. Let $\delta=\sum_{i \in I_{\mathrm{af}}} a_{i} \alpha_{i} \in \mathfrak{h}_{\mathrm{af}}^{*}$ and $\mathrm{c}=\sum_{i \in I_{\mathrm{af}}} a_{i}^{\vee} \alpha_{i}^{\vee} \in \mathfrak{h}_{\mathrm{af}}$ be the null root and the canonical central element, respectively. For $\lambda \in P_{\mathrm{af}}$, the integer $\langle\mathrm{c}, \lambda\rangle$ is called the level of $\lambda$. We take and fix $0 \in I_{\mathrm{af}}$ such that $a_{0}=a_{0}^{\vee}=1$. Set $I=$ $I_{\mathrm{af}} \backslash\{0\}$; note that the subset $I$ of $I_{\mathrm{af}}$ corresponds to the vertex set of the Dynkin diagram of a complex finite-dimensional simple Lie subalgebra $\mathfrak{g}$ of $\mathfrak{g}_{\text {af }}$. Fix a section $\iota: P_{\mathrm{af}} /\left(P_{\mathrm{af}} \cap \mathbb{C} \delta\right) \rightarrow P_{\mathrm{af}}$ (resp. $\left.\iota: P_{\mathrm{af}}^{\vee} /\left(P_{\mathrm{af}}^{\vee} \cap \mathbb{C} \mathrm{c}\right) \rightarrow P_{\mathrm{af}}^{\vee}\right)$ of the canonical surjection
$\mathrm{cl}: P_{\mathrm{af}} \rightarrow P_{\mathrm{af}} /\left(P_{\mathrm{af}} \cap \mathbb{C} \delta\right)$ (resp. cl : $\left.P_{\mathrm{af}}^{\vee} \rightarrow P_{\mathrm{af}}^{\vee} /\left(P_{\mathrm{af}}^{\vee} \cap \mathbb{C} \mathrm{c}\right)\right)$ such that $(\iota \circ \mathrm{cl})\left(\alpha_{i}\right)=\alpha_{i}$ (resp. $\left.(\iota \circ \mathrm{cl})\left(\alpha_{i}^{\vee}\right)=\alpha_{i}^{\vee}\right)$ for $i \in I$. For each $i \in I_{\text {af }}$, define $\varpi_{i}=(\iota \circ \mathrm{cl})\left(\Lambda_{i}-\left\langle\mathrm{c}, \Lambda_{i}\right\rangle \Lambda_{0}\right)$ and $\varpi_{i}^{\vee}=(\iota \circ \mathrm{cl})\left(\Lambda_{i}^{\vee}-\left\langle\Lambda_{i}^{\vee}, \delta\right\rangle \Lambda_{0}^{\vee}\right)$; note that $\varpi_{0}=0, \varpi_{0}^{\vee}=0,\left\langle\mathrm{c}, \varpi_{i}\right\rangle=\left\langle\varpi_{i}^{\vee}, \delta\right\rangle=$ 0 , and $\left\langle\alpha_{j}^{\vee}, \varpi_{i}\right\rangle=\left\langle\varpi_{i}^{\vee}, \alpha_{j}\right\rangle=\delta_{i j}$ for all $i, j \in I$. We call $\varpi_{i}$ the $i$-th level-zero fundamental weight of $\mathfrak{g}_{\mathrm{af}}$. Set

$$
\begin{equation*}
Q=\bigoplus_{i \in I} \mathbb{Z} \alpha_{i}, \quad Q^{\vee}=\bigoplus_{i \in I} \mathbb{Z} \alpha_{i}^{\vee}, \quad P=\bigoplus_{i \in I} \mathbb{Z} \varpi_{i}, \quad P^{+}=\sum_{i \in I} \mathbb{Z}_{\geqslant 0} \varpi_{i} ; \tag{7}
\end{equation*}
$$

 (resp. a root lattice) of $\mathfrak{g}$.

Let $W_{\text {af }}=\left\langle r_{i} \mid i \in I_{\text {af }}\right\rangle$ be the (affine) Weyl group of $\mathfrak{g}_{\text {af }}$, where $r_{i}$ denotes the simple reflection with respect to $\alpha_{i}$. The subgroup $W=\left\langle r_{i} \mid i \in I\right\rangle \subset W_{\text {af }}$ is the (finite) Weyl group of $\mathfrak{g}$. Let $\ell: W_{\text {af }} \rightarrow \mathbb{Z}_{\geqslant 0}$ be the length function. Let $e \in W_{\text {af }}$ be the unit element. The action of $W_{\text {af }}$ on $\mathfrak{h}_{\text {af }}^{*}\left(\right.$ resp. $\left.\mathfrak{h}_{\text {af }}\right)$ is given by $r_{i}(\lambda)=\lambda-\left\langle\alpha_{i}^{\vee}, \lambda\right\rangle \alpha_{i}$ (resp. $\left.r_{i}(h)=h-\left\langle h, \alpha_{i}\right\rangle \alpha_{i}^{\vee}\right)$ for $i \in I_{\text {af }}$ and $\lambda \in \mathfrak{h}_{\text {af }}^{*}$ (resp. $h \in \mathfrak{h}_{\text {af }}$ ). For $\xi \in Q^{\vee}$, we denote by $t_{\xi} \in W_{\text {af }}$ the translation by $\xi$ (see [13, §6.5]). We know from [13, Proposition 6.5] that $\left\{t_{\xi} \mid \xi \in Q^{\vee}\right\}$ forms an abelian normal subgroup of $W_{\text {af }}$, for which $t_{\xi} t_{\zeta}=t_{\xi+\zeta}, \xi, \zeta \in Q^{\vee}$, and $W_{\text {af }}=W \ltimes\left\{t_{\xi} \mid \xi \in Q^{\vee}\right\}$. For $w \in W$ and $\xi \in Q^{\vee}$, we have $w t_{\xi} \lambda=w \lambda-\langle\xi, \lambda\rangle \delta$ if $\lambda \in \mathfrak{h}_{\text {af }}^{*}$ satisfies $\langle\mathrm{c}, \lambda\rangle=0$.

Let $\Delta$ (resp. $\Delta^{\vee}$ ) be the root system (resp. the coroot system) of $\mathfrak{g}$ with a simple root system $\Pi=\left\{\alpha_{i} \mid i \in I\right\}$ (resp. a simple coroot system $\Pi^{\vee}=\left\{\alpha_{i}^{\vee} \mid i \in I\right\}$ ). Set $\Delta^{+}=\Delta \cap \sum_{i \in I} \mathbb{Z}_{\geqslant 0} \alpha_{i}$ and $\Delta^{\vee,+}=\Delta^{\vee} \cap \sum_{i \in I} \mathbb{Z}_{\geqslant 0} \alpha_{i}^{\vee}$. For a subset $J \subset I$, set

$$
\begin{array}{llc}
Q_{J}=\bigoplus_{j \in J} \mathbb{Z} \alpha_{j}, & \Delta_{J}=\Delta \cap Q_{J}, & \Delta_{J}^{+}=\Delta^{+} \cap Q_{J} \\
Q_{J}^{\vee}=\bigoplus_{j \in J} \mathbb{Z} \alpha_{j}^{\vee}, & \Delta_{J}^{\vee}=\Delta^{\vee} \cap Q_{J}^{\vee}, & \Delta_{J}^{\vee,+}=\Delta^{\vee,+} \cap Q_{J}^{\vee}
\end{array}
$$

Denote by $\Delta_{\text {af }}$ the set of real roots of $\mathfrak{g}_{\text {af }}$, and by $\Delta_{\text {af }}^{+}$the set of positive real roots of $\mathfrak{g}_{\text {af }}$; we know from [13, Proposition 6.3] that

$$
\begin{equation*}
\Delta_{\mathrm{af}}=\{\alpha+n \delta \mid \alpha \in \Delta, n \in \mathbb{Z}\}, \quad \Delta_{\mathrm{af}}^{+}=\Delta^{+} \sqcup\left\{\alpha+n \delta \mid \alpha \in \Delta, n \in \mathbb{Z}_{>0}\right\} \tag{10}
\end{equation*}
$$

Let $\beta^{\vee} \in \mathfrak{h}_{\mathrm{af}}$ denote the coroot of $\beta \in \Delta_{\mathrm{af}}$. Let $r_{\beta} \in W_{\mathrm{af}}$ be the reflection with respect to $\beta \in \Delta_{\text {af }}$; if $\beta=\alpha+n \delta, \alpha \in \Delta$ and $n \in \mathbb{Z}$, then $r_{\beta}=r_{\alpha} t_{n \alpha^{\vee}}$.
2.2. Crystals. In this subsection, we set up notation and terminology on crystals. For a fuller treatment, we refer the reader to [14, 16].

Let $\mathbf{U}$ be the quantized universal enveloping algebra associated with $\mathfrak{g}_{\text {af }}$. Let $\mathbf{U}^{\prime}$ be the subalgebra of $\mathbf{U}$ corresponding to the derived subalgebra $\left[\mathfrak{g}_{\mathrm{af}}, \mathfrak{g}_{\mathrm{af}}\right.$ ] of $\mathfrak{g}_{\mathrm{af}}$ (see for instance [3, §2.2]).

A set $\mathcal{B}$ together with the maps wt: $\mathcal{B} \rightarrow P_{\text {af }}$ (resp. wt: $\mathcal{B} \rightarrow P_{\text {af }} /\left(P_{\mathrm{af}} \cap \mathbb{C} \delta\right)$ ), $e_{i}, f_{i}: \mathcal{B} \rightarrow \mathcal{B} \sqcup\{\mathbf{0}\}$, and $\varepsilon_{i}, \varphi_{i}: \mathcal{B} \rightarrow \mathbb{Z} \sqcup\{-\infty\}, i \in I_{\mathrm{af}}$, is called a U-crystal (resp. a $\mathbf{U}^{\prime}$-crystal) if the following conditions are satisfied:
(C1) $\varphi_{i}(b)=\varepsilon_{i}(b)+\left\langle\alpha_{i}^{\vee}, \mathrm{wt}(b)\right\rangle$ for $b \in \mathcal{B}$ and $i \in I_{\mathrm{af}}$,
(C2) $\mathrm{wt}\left(e_{i} b\right)=\mathrm{wt}(b)+\alpha_{i}$ if $e_{i} b \in \mathcal{B}$,
(C3) $\operatorname{wt}\left(f_{i} b\right)=\mathrm{wt}(b)-\alpha_{i}$ if $f_{i} b \in \mathcal{B}$,
(C4) $\varepsilon_{i}\left(e_{i} b\right)=\varepsilon_{i}(b)-1$ and $\varphi_{i}\left(e_{i} b\right)=\varphi_{i}(b)+1$ if $e_{i} b \in \mathcal{B}$,
(C5) $\varepsilon_{i}\left(f_{i} b\right)=\varepsilon_{i}(b)+1$ and $\varphi_{i}\left(f_{i} b\right)=\varphi_{i}(b)-1$ if $f_{i} b \in \mathcal{B}$,
(C6) $f_{i} b=b^{\prime}$ if and only if $b=e_{i} b^{\prime}$ for $b, b^{\prime} \in \mathcal{B}$ and $i \in I_{\mathrm{af}}$,
(C7) if $\varphi_{i}(b)=-\infty$, then $e_{i} b=f_{i} b=\mathbf{0}$.
A set $\mathcal{B}$ together with the maps wt $: \mathcal{B} \rightarrow P$ and $e_{i}, f_{i}, \varepsilon_{i}, \varphi_{i}$ for $i \in I$ as above is called a $\mathfrak{g}$-crystal if these maps satisfy (C1)-(C7). We can think of a $\mathbf{U}^{\prime}$-crystal $\mathcal{B}$ such that $\operatorname{wt}(\mathcal{B}) \subset P /(P \cap \mathbb{C} \delta) \cong P$ as a $\mathfrak{g}$-crystal by forgetting the maps $e_{0}, f_{0}, \varepsilon_{0}, \varphi_{0}$.

Following [16, §4.2], define the affinization $\mathcal{B}_{\mathrm{af}}=\mathcal{B} \times \mathbb{Z}$ of a $\mathbf{U}^{\prime}$-crystal $\mathcal{B}$ to be the $\mathbf{U}$-crystal such that for $b \in \mathcal{B}, c \in \mathbb{Z}$, and $i \in I_{\mathrm{af}}, \mathrm{wt}(b, c)=\iota(\mathrm{wt}(b))-c \delta \in P_{\mathrm{af}}$, $e_{i}(b, c)=\left(e_{i} b, c-\delta_{i, 0}\right), f_{i}(b, c)=\left(f_{i} b, c+\delta_{i, 0}\right), \varepsilon_{i}(b, c)=\varepsilon_{i}(b)$, and $\varphi_{i}(b, c)=\varphi_{i}(b) ;$ we understand that $(\mathbf{0}, c)=\mathbf{0}$.

Let $\mathcal{B}_{1}$ and $\mathcal{B}_{2}$ be $\mathbf{U}$-crystals or $\mathbf{U}^{\prime}$-crystals. A morphism $\Psi: \mathcal{B}_{1} \rightarrow \mathcal{B}_{2}$ is, by definition, a map $\mathcal{B}_{1} \sqcup\{\mathbf{0}\} \rightarrow \mathcal{B}_{2} \sqcup\{\mathbf{0}\}$ such that
$(\mathrm{CM} 1) \Psi(\mathbf{0})=\mathbf{0}$,
(CM2) if $b \in \mathcal{B}_{1}$ and $\Psi(b) \in \mathcal{B}_{2}$, then $\mathrm{wt}(\Psi(b))=\mathrm{wt}(b), \varepsilon_{i}(\Psi(b))=\varepsilon_{i}(b)$, and $\varphi_{i}(\Psi(b))=\varphi_{i}(b)$ for all $i \in I_{\text {af }}$,
(CM3) if $b, b^{\prime} \in \mathcal{B}_{1}, \Psi(b), \Psi\left(b^{\prime}\right) \in \mathcal{B}_{2}$ and $f_{i} b=b^{\prime}$, then $f_{i} \Psi(b)=\Psi\left(b^{\prime}\right)$ for all $i \in I_{\mathrm{af}}$. A morphism $\Psi: \mathcal{B}_{1} \rightarrow \mathcal{B}_{2}$ is called strict if $\Psi\left(f_{i} b\right)=f_{i} \Psi(b)$ and $\Psi\left(e_{i} b\right)=e_{i} \Psi(b)$ for all $b \in \mathcal{B}_{1}$ and $i \in I_{\text {af }}$. A morphism $\Psi: \mathcal{B}_{1} \rightarrow \mathcal{B}_{2}$ is called a strict embedding if it is a strict morphism and the associated map $\mathcal{B}_{1} \sqcup\{\mathbf{0}\} \rightarrow \mathcal{B}_{2} \sqcup\{\mathbf{0}\}$ is injective. A morphism $\Psi: \mathcal{B}_{1} \rightarrow \mathcal{B}_{2}$ is called an isomorphism if the associated map $\mathcal{B}_{1} \sqcup\{\mathbf{0}\} \rightarrow \mathcal{B}_{2} \sqcup\{\mathbf{0}\}$ is bijective. In the same manner we define morphisms of $\mathfrak{g}$-crystals.

The tensor product $\mathcal{B}_{1} \otimes \mathcal{B}_{2}$ of crystals $\mathcal{B}_{1}$ and $\mathcal{B}_{2}$ is defined to be the set $\left\{b_{1} \otimes b_{2} \mid\right.$ $\left.b_{1} \in \mathcal{B}_{1}, b_{2} \in \mathcal{B}_{2}\right\}$ whose crystal structure is as follows:
(T1) $\mathrm{wt}\left(b_{1} \otimes b_{2}\right)=\mathrm{wt}\left(b_{1}\right)+\mathrm{wt}\left(b_{2}\right)$,
(T2) $\varepsilon_{i}\left(b_{1} \otimes b_{2}\right)=\max \left\{\varepsilon_{i}\left(b_{1}\right), \varepsilon_{i}\left(b_{2}\right)-\left\langle\alpha_{i}^{\vee}, \mathrm{wt}\left(b_{1}\right)\right\rangle\right\}$,
(T3) $\varphi_{i}\left(b_{1} \otimes b_{2}\right)=\max \left\{\varphi_{i}\left(b_{2}\right), \varphi_{i}\left(b_{1}\right)+\left\langle\alpha_{i}^{\vee}, \operatorname{wt}\left(b_{2}\right)\right\rangle\right\}$,
(T4) $e_{i}\left(b_{1} \otimes b_{2}\right)= \begin{cases}\left(e_{i} b_{1}\right) \otimes b_{2} & \text { if } \varphi_{i}\left(b_{1}\right) \geqslant \varepsilon_{i}\left(b_{2}\right), \\ b_{1} \otimes\left(e_{i} b_{2}\right) & \text { if } \varphi_{i}\left(b_{1}\right)<\varepsilon_{i}\left(b_{2}\right),\end{cases}$
(T5) $f_{i}\left(b_{1} \otimes b_{2}\right)= \begin{cases}\left(f_{i} b_{1}\right) \otimes b_{2} & \text { if } \varphi_{i}\left(b_{1}\right)>\varepsilon_{i}\left(b_{2}\right), \\ b_{1} \otimes\left(f_{i} b_{2}\right) & \text { if } \varphi_{i}\left(b_{1}\right) \leqslant \varepsilon_{i}\left(b_{2}\right) .\end{cases}$
Here, we understand that $b_{1} \otimes \mathbf{0}=\mathbf{0} \otimes b_{2}=\mathbf{0}$.
Let $\mathcal{B}$ be a regular $\mathbf{U}$-crystal in the sense of $[16, \S 2.2]$. It follows that

$$
\begin{equation*}
\varphi_{i}(b)=\max \left\{k \in \mathbb{Z}_{\geqslant 0} \mid f_{i}^{k} b \neq \mathbf{0}\right\}, \quad \varepsilon_{i}(b)=\max \left\{k \in \mathbb{Z}_{\geqslant 0} \mid e_{i}^{k} b \neq \mathbf{0}\right\} \tag{11}
\end{equation*}
$$

for $b \in \mathcal{B}$ and $i \in I_{\mathrm{af}}$. Define $f_{i}^{\max } b=f_{i}^{\varphi_{i}(b)} b \in \mathcal{B}$ and $e_{i}^{\max } b=e_{i}^{\varepsilon_{i}(b)} b \in \mathcal{B}$ for $b \in \mathcal{B}$ and $i \in I_{\mathrm{af}}$. By $[14, \S 7]$, we have a $W_{\text {af }}$-action $S: W_{\mathrm{af}} \rightarrow \mathfrak{S}(\mathcal{B}), x \mapsto S_{x}$, on (the underlying set) $\mathcal{B}$ given by

$$
S_{r_{i}} b= \begin{cases}f_{i}^{\left\langle\alpha_{i}^{\vee}, \mathrm{wt}(b)\right\rangle} b & \text { if }\left\langle\alpha_{i}^{\vee}, \mathrm{wt}(b)\right\rangle \geqslant 0  \tag{12}\\ e_{i}^{-\left\langle\alpha_{i}^{\vee}, \mathrm{wt}(b)\right\rangle} b & \text { if }\left\langle\alpha_{i}^{\vee}, \operatorname{wt}(b)\right\rangle \leqslant 0\end{cases}
$$

for $b \in \mathcal{B}$ and $i \in I_{\mathrm{af}}$. Note that $\mathrm{wt}\left(S_{x} b\right)=x \mathrm{wt}(b)$ holds for all $x \in W_{\mathrm{af}}$ and $b \in \mathcal{B}$. An element $b \in \mathcal{B}$ of weight $\operatorname{wt}(b)=\lambda \in P_{\text {af }}$ is called an extremal element if there exist $b_{x} \in \mathcal{B}, x \in W_{\text {af }}$, such that
(E1) $b_{e}=b$,
(E2) if $\left\langle\alpha_{i}^{\vee}, x \lambda\right\rangle \geqslant 0$, then $e_{i} b_{x}=\mathbf{0}$ and $f_{i}^{\left\langle\alpha_{i}^{\vee}, x \lambda\right\rangle} b_{x}=f_{i}^{\max } b_{x}=b_{r_{i} x}$,
(E3) if $\left\langle\alpha_{i}^{\vee}, x \lambda\right\rangle \leqslant 0$, then $f_{i} b_{x}=\mathbf{0}$ and $e_{i}^{-\left\langle\alpha_{i}^{\vee}, x \lambda\right\rangle} b_{x}=e_{i}^{\max } b_{x}=b_{r_{i} x}$.
Then $b_{x}=S_{x} b$ holds for all $x \in W_{\text {af }}$, and each $b_{x}$ is an extremal element of weight $x \lambda$. The proof of the next lemma is straightforward.

Lemma 2.1. (1) Let $\mathcal{B}$ be a regular $\mathbf{U}$-crystal, and let $b \in \mathcal{B}$ be an extremal element. If there exist $i_{1}, i_{2}, \ldots, i_{N} \in I_{\mathrm{af}}$ such that

$$
\begin{equation*}
\left\langle\alpha_{i_{n}}^{\vee}, r_{i_{n-1}} \cdots r_{i_{2}} r_{i_{1}} \mathrm{wt}(b)\right\rangle \geqslant 0 \text { for all } n \in[N] \tag{13}
\end{equation*}
$$

$$
\begin{equation*}
f_{i_{N}}^{\max } \cdots f_{i_{2}}^{\max } f_{i_{1}}^{\max } b=S_{r_{i_{N}} \cdots r_{i_{2}} r_{i_{1}}} b \tag{14}
\end{equation*}
$$

(2) Let $\mathcal{B}_{1}, \mathcal{B}_{2}, \ldots, \mathcal{B}_{M}$ be regular $\mathbf{U}$-crystals, and let $b_{\nu} \in \mathcal{B}_{\nu}, \nu \in[M]$, be extremal elements such that, for every $\beta \in \Delta_{\mathrm{af}},\left\langle\beta^{\vee}, \mathrm{wt}\left(b_{\nu}\right)\right\rangle, \nu \in[M]$, are all nonnegative or all nonpositive. Then the equalities

$$
\begin{align*}
f_{i}^{\max }\left(b_{1} \otimes b_{2} \otimes \cdots \otimes b_{M}\right) & =f_{i}^{\max } b_{1} \otimes f_{i}^{\max } b_{2} \otimes \cdots \otimes f_{i}^{\max } b_{M}  \tag{15}\\
S_{x}\left(b_{1} \otimes b_{2} \otimes \cdots \otimes b_{M}\right) & =S_{x} b_{1} \otimes S_{x} b_{2} \otimes \cdots \otimes S_{x} b_{M} \tag{16}
\end{align*}
$$

hold and (15)-(16) are extremal elements for all $i \in I_{\mathrm{af}}$ and $x \in W_{\mathrm{af}}$.
2.3. Semi-infinite Bruhat order. In this subsection, we collect some basic facts on semi-infinite Bruhat order on an affine Weyl group (see [11, 20, 32] for more details). Throughout this subsection, we take and fix $J \subset I$.

Let $W_{J}=\left\langle r_{j} \mid j \in J\right\rangle$, and let $W^{J}$ be the set of minimal(-length) coset representatives for $W / W_{J}$. For $w \in W$, we denote by $\lfloor w\rfloor=\lfloor w\rfloor^{J} \in W^{J}$ the minimal coset representative for the coset $w W_{J} \in W / W_{J}$. Define

$$
\begin{align*}
& \left(\Delta_{J}\right)_{\mathrm{af}}=\left\{\alpha+n \delta \mid \alpha \in \Delta_{J}, n \in \mathbb{Z}\right\} \subset \Delta_{\mathrm{af}}  \tag{17}\\
& \left(\Delta_{J}\right)_{\mathrm{af}}^{+}=\left(\Delta_{J}\right)_{\mathrm{af}} \cap \Delta_{\mathrm{af}}^{+}=\Delta_{J}^{+} \sqcup\left\{\alpha+n \delta \mid \alpha \in \Delta_{J}, n \in \mathbb{Z}_{>0}\right\}  \tag{18}\\
& \left(W_{J}\right)_{\mathrm{af}}=W_{J} \ltimes\left\{t_{\xi} \mid \xi \in Q_{J}^{\vee}\right\}=\left\langle r_{\beta} \mid \beta \in\left(\Delta_{J}\right)_{\mathrm{af}}^{+}\right\rangle  \tag{19}\\
& \left(W^{J}\right)_{\mathrm{af}}=\left\{x \in W_{\mathrm{af}} \mid x \beta \in \Delta_{\mathrm{af}}^{+} \text {for all } \beta \in\left(\Delta_{J}\right)_{\mathrm{af}}^{+}\right\} \tag{20}
\end{align*}
$$

note that $\left(W_{\varnothing}\right)_{\mathrm{af}}=\{e\}$ and $\left(W^{\varnothing}\right)_{\mathrm{af}}=W_{\mathrm{af}}$.
We see from [32] (see also [20, Lemma 10.5]) that, for each $x \in W_{\mathrm{af}}$, there exist a unique $x_{1} \in\left(W^{J}\right)_{\text {af }}$ and a unique $x_{2} \in\left(W_{J}\right)_{\text {af }}$ such that $x=x_{1} x_{2}$. Define $\Pi^{J}$ : $W_{\text {af }} \rightarrow\left(W^{J}\right)_{\text {af }}$ by $\Pi^{J}(x)=x_{1}$ if $x=x_{1} x_{2}$ with $x_{1} \in\left(W^{J}\right)_{\text {af }}$ and $x_{2} \in\left(W_{J}\right)_{\text {af }}$. It follows immediately from (17)-(20) that $\Pi^{J}=\Pi^{J} \circ \Pi^{K}$ if $K \subset J$.

Set $\rho_{J}=(1 / 2) \sum_{\alpha \in \Delta_{J}^{+}} \alpha$; we abbreviate $\rho_{J}$ to $\rho$ if $J=I$. Define the semi-infinite length function $\ell^{\frac{\infty}{2}}: W_{\mathrm{af}} \rightarrow \mathbb{Z}$ by

$$
\begin{equation*}
\ell^{\frac{\infty}{2}}(x)=\ell(w)+2\langle\xi, \rho\rangle \tag{21}
\end{equation*}
$$

for $x=w t_{\xi} \in W_{\text {af }}$ with $w \in W$ and $\xi \in Q^{\vee}$.
Define the (parabolic) semi-infinite Bruhat graph $\mathrm{SiB}^{J}$ to be the $\Delta_{\text {af }}^{+}$-colored directed graph with vertex set $\left(W^{J}\right)_{\text {af }}$ and edges of the form $x \xrightarrow{\beta} r_{\beta} x$ for $x \in\left(W^{J}\right)_{\text {af }}$ and $\beta \in \Delta_{\mathrm{af}}^{+}$, where $r_{\beta} x \in\left(W^{J}\right)_{\text {af }}$ and $\ell^{\frac{\infty}{2}}\left(r_{\beta} x\right)=\ell^{\frac{\infty}{2}}(x)+1$. We know from [11, Appendix A] that the existence of the edge $x \xrightarrow{\beta} \Pi^{J}\left(r_{\beta} x\right)$ in $\mathrm{SiB}^{J}$ implies $r_{\beta} x=\Pi^{J}\left(r_{\beta} x\right) \in\left(W^{J}\right)_{\mathrm{af}}$. The semi-infinite Bruhat order is a partial order $\succeq$ on $\left(W^{J}\right)_{\text {af }}$ defined as follows: for $x, y \in\left(W^{J}\right)_{\mathrm{af}}$, write $x \succeq y$ if there exists a directed path from $y$ to $x$ in $\mathrm{SiB}^{J}$. Write $x \succ y$ if $x \succeq y$ and $x \neq y$.
Lemma 2.2. Let $\lambda \in P^{+}$be such that $J=\left\{i \in I \mid\left\langle\alpha_{i}^{\vee}, \lambda\right\rangle=0\right\}$. We have $x \lambda=\Pi^{J}(x) \lambda$ for all $x \in W_{\text {af }}$.
Proof. The assertion follows from $\left\langle\beta^{\vee}, \lambda\right\rangle=0$ for all $\beta \in\left(\Delta_{J}\right)_{\mathrm{af}}^{+}$.
Lemma 2.3 ([32]; see also [20, Lemma 10.7 and Proposition 10.10]).
(1) $\Pi^{J}(w)=\lfloor w\rfloor^{J}$ for $w \in W$.
(2) $\Pi^{J}\left(x t_{\xi}\right)=\Pi^{J}(x) \Pi^{J}\left(t_{\xi}\right)$ for $x \in W_{\text {af }}$ and $\xi \in Q^{\vee}$.

For simplicity of notation, we let $T_{\xi}^{J}$ stand for $\Pi^{J}\left(t_{\xi}\right) \in\left(W^{J}\right)_{\text {af }}$ for $\xi \in Q^{\vee}$. By Lemma 2.3, we have

$$
\begin{equation*}
\left(W^{J}\right)_{\mathrm{af}}=\left\{w T_{\xi}^{J} \mid w \in W^{J}, \xi \in Q^{\vee}\right\} \tag{22}
\end{equation*}
$$

Let

$$
\begin{equation*}
[\cdot]_{I \backslash J}: Q^{\vee}=Q_{J}^{\vee} \oplus Q_{I \backslash J}^{\vee} \rightarrow Q_{I \backslash J}^{\vee} \tag{23}
\end{equation*}
$$

be the projection. For $\xi_{1}, \xi_{2} \in Q^{\vee}$, write $\xi_{1} \succeq \xi_{2}$ if $\xi_{1}-\xi_{2} \in \sum_{i \in I} \mathbb{Z}_{\geqslant 0} \alpha_{i}^{\vee}$.
Lemma 2.4 ([11, Lemmas 6.1.1 and 6.2.1]).
(1) Let $K \subset J$ and $x, y \in\left(W^{K}\right)_{\mathrm{af}}$. If $x \succeq y$ in $\left(W^{K}\right)_{\mathrm{af}}$, then $\Pi^{J}(x) \succeq \Pi^{J}(y)$ in $\left(W^{J}\right)_{\mathrm{af}}$.
(2) Let $\xi_{1}, \xi_{2} \in Q^{\vee}$. We have $\Pi^{J}\left(t_{\xi_{1}}\right) \succeq \Pi^{J}\left(t_{\xi_{2}}\right)$ if and only if $\left[\xi_{1}\right]_{I \backslash J} \succeq\left[\xi_{2}\right]_{I \backslash J}$. In particular, we have $\Pi^{J}\left(t_{\xi_{1}}\right) \succeq \Pi^{J}\left(t_{\xi_{2}}\right)$ if and only if $\Pi^{I \backslash\{i\}}\left(t_{\xi_{1}}\right) \succeq \Pi^{I \backslash\{i\}}\left(t_{\xi_{2}}\right)$ for all $i \in I \backslash J$.
Lemma 2.5 ([11, Remark 4.1.3]). Let $x \in\left(W^{J}\right)_{\mathrm{af}}, i \in I_{\mathrm{af}}$, and let $\lambda \in P^{+}$be such that $J=\left\{j \in I \mid\left\langle\alpha_{j}^{\vee}, \lambda\right\rangle=0\right\}$.
(1) $r_{i} x=\Pi^{J}\left(r_{i} x\right) \in\left(W^{J}\right)_{\text {af }}$ if and only if $\left\langle\alpha_{i}^{\vee}, x \lambda\right\rangle \neq 0$.
(2) $x=\Pi^{J}\left(r_{i} x\right)$ if and only if $\left\langle\alpha_{i}^{\vee}, x \lambda\right\rangle=0$.
(3) $r_{i} x \stackrel{\alpha_{i}}{\leftarrow} x\left(\right.$ resp. $\left.x \stackrel{\alpha_{i}}{\leftarrow} r_{i} x\right)$ if and only if $\left\langle\alpha_{i}^{\vee}, x \lambda\right\rangle>0\left(\right.$ resp. $\left.\left\langle\alpha_{i}^{\vee}, x \lambda\right\rangle<0\right)$.

The next lemma is a reformulation of the "diamond lemma" for semi-infinite Bruhat order obtained in [11, §4.1].
LEMMA 2.6. Let $x, y \in\left(W^{J}\right)_{\text {af }}$ and $i \in I_{\mathrm{af}}$ be such that $\Pi^{J}\left(r_{i} x\right) \succeq x$ and $\Pi^{J}\left(r_{i} y\right) \succeq y$.
(1) If $\Pi^{J}\left(r_{i} x\right) \succeq y$, then $x \succeq y$ and $\Pi^{J}\left(r_{i} x\right) \succeq \Pi^{J}\left(r_{i} y\right)$.
(2) $x \succeq y$ if and only if $\Pi^{J}\left(r_{i} x\right) \succeq \Pi^{J}\left(r_{i} y\right)$.

Lemma 2.7. Let $w, v \in W$ and $\xi, \zeta \in Q^{\vee}$. If $\Pi^{J}\left(w t_{\xi}\right) \succeq \Pi^{J}\left(w t_{\zeta}\right)$, then $\Pi^{J}\left(v t_{\xi}\right) \succeq$ $\Pi^{J}\left(v t_{\zeta}\right)$.
Proof. It suffices to prove that $\Pi^{J}\left(w t_{\xi}\right) \succeq \Pi^{J}\left(w t_{\zeta}\right)$ if and only if $\Pi^{J}\left(t_{\xi}\right) \succeq \Pi^{J}\left(t_{\zeta}\right)$. The proof is by induction on $\ell(w)$. If $\ell(w)=0$, then the assertion is obvious. Assume that $\ell(w)>0$. Let $i \in I$ be such that $\ell\left(r_{i} w\right)<\ell(w)$. By induction hypothesis, $\Pi^{J}\left(r_{i} w t_{\xi}\right) \succeq \Pi^{J}\left(r_{i} w t_{\zeta}\right)$ if and only if $\Pi^{J}\left(t_{\xi}\right) \succeq \Pi^{J}\left(t_{\zeta}\right)$. The proof is completed by showing that $\Pi^{J}\left(r_{i} w t_{\xi}\right) \succeq \Pi^{J}\left(r_{i} w t_{\zeta}\right)$ if and only if $\Pi^{J}\left(w t_{\xi}\right) \succeq \Pi^{J}\left(w t_{\zeta}\right)$. Let $\lambda \in P^{+}$ be such that $J=\left\{j \in I \mid\left\langle\alpha_{j}^{\vee}, \lambda\right\rangle=0\right\}$; note that $0 \geqslant\left\langle\alpha_{i}^{\vee}, w \lambda\right\rangle=\left\langle\alpha_{i}^{\vee}, \Pi^{J}\left(w t_{\xi}\right) \lambda\right\rangle=$ $\left\langle\alpha_{i}^{\vee}, \Pi^{J}\left(w t_{\zeta}\right) \lambda\right\rangle$. We see from Lemma $2.5(2)-(3)$ that $\Pi^{J}\left(w t_{\xi}\right) \succeq \Pi^{J}\left(r_{i} w t_{\xi}\right)$ and $\Pi^{J}\left(w t_{\zeta}\right) \succeq \Pi^{J}\left(r_{i} w t_{\zeta}\right)$. By Lemma $2.6(2), \Pi^{J}\left(r_{i} w t_{\xi}\right) \succeq \Pi^{J}\left(r_{i} w t_{\zeta}\right)$ if and only if $\Pi^{J}\left(w t_{\xi}\right) \succeq \Pi^{J}\left(w t_{\zeta}\right)$.
2.4. Extremal weight modules and their crystal bases. In this subsection, following $[3,14,16]$, we review some of the standard facts on extremal weight modules and their crystal bases.

For $\lambda \in P^{+}$, let $V(\lambda)$ be the extremal weight $\mathbf{U}$-module generated by an extremal weight vector $u_{\lambda}$ of extremal weight $\lambda$, and let $\mathcal{B}(\lambda)$ be the crystal basis of $V(\lambda)$ ([14, Proposition 8.2.2]; see also $[16, \S 3.2]$ ). Note that $\mathcal{B}(\lambda)$ is a regular U-crystal in the sense of $[16, \S 2.2]$ (see $\S 2.2$ ). Let $z_{i}, i \in I$, be the $\mathbf{U}^{\prime}$-linear automorphism of $V\left(\varpi_{i}\right)$ of weight $\delta$ introduced in $[16, \S 5.2] ; z_{i}$ sends a (unique) global basis element of weight $\varpi_{i}$ to a (unique) global basis element of weight $\varpi_{i}+\delta$. Then $z_{i}$ induces an automorphism of $\mathcal{B}\left(\varpi_{i}\right)$ as a $\mathbf{U}^{\prime}$-crystal; by abuse of notation, we use the same letter $z_{i}$ for the automorphism of $\mathcal{B}\left(\varpi_{i}\right)$. The $\mathbf{U}^{\prime}$-module $W\left(\varpi_{i}\right)=V\left(\varpi_{i}\right) /\left(z_{i}-1\right) V\left(\varpi_{i}\right)$ is called a level-zero fundamental representation. We know from [16, Theorem 5.17]
that $W\left(\varpi_{i}\right)$ is a finite-dimensional irreducible $\mathbf{U}^{\prime}$-module and has a (simple) crystal basis.

For $\lambda=\sum_{i \in I} m_{i} \varpi_{i} \in P^{+}$, with $m_{i} \in \mathbb{Z}_{\geqslant 0}, i \in I$, set $\breve{\mathcal{B}}(\lambda)=\bigotimes_{i \in I} \mathcal{B}\left(\varpi_{i}\right)^{\otimes m_{i}}$. For each $i \in I$ and $\nu \in\left[m_{i}\right]$, let $z_{i, \nu}$ be the automorphism of the $\mathbf{U}^{\prime}$-crystal $\breve{\mathcal{B}}(\lambda)$ obtained by the action of $z_{i}$ on the $\nu$-th factor $\mathcal{B}\left(\varpi_{i}\right)$ of $\mathcal{B}\left(\varpi_{i}\right)^{\otimes m_{i}}$ in $\breve{\mathcal{B}}(\lambda)$. Set
(24) $\operatorname{Par}(\lambda)=\left\{\boldsymbol{\rho}=\left(\rho^{(i)}\right)_{i \in I} \mid \rho^{(i)}\right.$ is a partition of length less than $m_{i}$ for $\left.i \in I\right\}$; we understand that a partition of length less than 1 is an empty partition $\varnothing$. Let $\boldsymbol{\rho}=\left(\rho^{(i)}\right)_{i \in I} \in \operatorname{Par}(\lambda)$ and $\rho^{(i)}=\left(\rho_{1}^{(i)} \geqslant \rho_{2}^{(i)} \geqslant \cdots \geqslant \rho_{m_{i}-1}^{(i)} \geqslant 0\right), i \in I$. Define the automorphism $z^{-\rho}$ of the $\mathbf{U}^{\prime}$-crystal $\breve{\mathcal{B}}(\lambda)$ by

$$
\begin{equation*}
z^{-\rho}=\prod_{i \in I} z_{i, 1}^{-\rho_{1}^{(i)}} z_{i, 2}^{-\rho_{2}^{(i)}} \cdots z_{i, m_{i}-1}^{-\rho_{m_{i}-1}^{(i)}} \tag{25}
\end{equation*}
$$

Let $S_{\boldsymbol{\rho}}^{-}$be the (PBW-type) basis element of weight

$$
\begin{equation*}
\operatorname{wt}(\boldsymbol{\rho})=-\sum_{i \in I} \sum_{\nu=1}^{m_{i}-1} \rho_{\nu}^{(i)} \delta \tag{26}
\end{equation*}
$$

of the negative imaginary part of $\mathbf{U}$ constructed in [3, the element $S_{\mathbf{c}_{0}}^{-}$in $\S 3.1$; see also Remark 4.1]. We know from [3, §4.2] that

$$
\begin{align*}
\mathcal{B}(\lambda)=\{ & g_{1} g_{2} \cdots g_{l} S_{\boldsymbol{\rho}}^{-} u_{\lambda} \\
& \left.\mid g_{k} \in\left\{e_{i}, f_{i} \mid i \in I_{\mathrm{af}}\right\}, k \in[l], l \in \mathbb{Z}_{\geqslant 0}, \boldsymbol{\rho} \in \operatorname{Par}(\lambda)\right\} \backslash\{0\} . \tag{27}
\end{align*}
$$

Define

$$
\begin{equation*}
\Phi_{\lambda \mid q=0}^{\mathrm{LT}}: \mathcal{B}(\lambda) \rightarrow \breve{\mathcal{B}}(\lambda), g_{1} g_{2} \cdots g_{l} S_{\rho}^{-} u_{\lambda} \mapsto g_{1} g_{2} \cdots g_{l} z^{-\rho}\left(\bigotimes_{i \in I} u_{\varpi_{i}}^{\otimes m_{i}}\right) \tag{28}
\end{equation*}
$$

where $g_{k} \in\left\{e_{i}, f_{i} \mid i \in I_{\mathrm{af}}\right\}, k \in[l], l \in \mathbb{Z}_{\geqslant 0}$, and $\boldsymbol{\rho} \in \operatorname{Par}(\lambda)$. We know from [10, Lemma 3.1] that the map $\Phi_{\lambda \mid q=0}^{\mathrm{LT}}$ is a strict embedding of $\mathbf{U}$-crystals.

The next theorem will be needed in § 5 .
Theorem 2.8 ([3, Remark 4.17]; see also [16, Conjecture 13.1 (iii)]). Let $\lambda=$ $\sum_{i \in I} m_{i} \varpi_{i} \in P^{+}$. We have an isomorphism $\mathcal{B}(\lambda) \cong \bigotimes_{i \in I} \mathcal{B}\left(m_{i} \varpi_{i}\right)$ of $\mathbf{U}$-crystals.
2.5. Path model for Demazure crystals. In this subsection, we give a brief exposition of the path model for the crystal bases of level-zero extremal weight Umodules and their Demazure submodules. For a fuller treatment we refer the reader to $[3,11,14,16,17,29]$.

For $\lambda=\sum_{i \in I} m_{i} \varpi_{i} \in P^{+}$, set

$$
\begin{equation*}
J_{\lambda}=\left\{j \in I \mid\left\langle\alpha_{j}^{\vee}, \lambda\right\rangle=0\right\}, \quad J_{\lambda}^{c}=I \backslash J_{\lambda} \tag{29}
\end{equation*}
$$

For a rational number $0<a \leqslant 1$, define $\operatorname{SiB}(\lambda ; a)$ to be the subgraph of $\operatorname{SiB}^{J_{\lambda}}$ with the same vertex set but having only the edges of the form

$$
\begin{equation*}
x \xrightarrow{\beta} y \text { with } a\left\langle\beta^{\vee}, x \lambda\right\rangle \in \mathbb{Z} ; \tag{30}
\end{equation*}
$$

note that $\mathrm{SiB}(\lambda ; 1)=\mathrm{SiB}^{J_{\lambda}}$. A semi-infinite Lakshmibai-Seshadri path of shape $\lambda$ is, by definition, a pair ( $\boldsymbol{x} ; \boldsymbol{a}$ ) of a decreasing sequence $\boldsymbol{x}: x_{1} \succeq x_{2} \succeq \cdots \succeq x_{l}$ of elements in $\left(W^{J_{\lambda}}\right)_{\text {af }}$ and an increasing sequence $\boldsymbol{a}: 0=a_{0}<a_{1}<\cdots<a_{l}=1$ of rational numbers such that there exists a directed path from $x_{u+1}$ to $x_{u}$ in $\operatorname{SiB}\left(\lambda ; a_{u}\right)$ for each $u \in[l-1]$. Let $\mathbb{B}^{\frac{\infty}{2}}(\lambda)$ denote the set of semi-infinite Lakshmibai-Seshadri paths of shape $\lambda$.

Following [11, §3.1], we equip the set $\mathbb{B}^{\frac{\infty}{2}}(\lambda)$ with a U-crystal structure. For $\eta=$ $\left(x_{1}, \ldots, x_{l} ; a_{0}, \ldots, a_{l}\right) \in \mathbb{B}^{\frac{\infty}{2}}(\lambda)$, define the map $\bar{\eta}:\{t \in \mathbb{R} \mid 0 \leqslant t \leqslant 1\} \rightarrow \mathbb{R} \otimes_{\mathbb{Z}} P_{\text {af }}$ by

$$
\begin{equation*}
\bar{\eta}(t)=\sum_{p=1}^{u-1}\left(a_{p}-a_{p-1}\right) x_{p} \lambda+\left(t-a_{u-1}\right) x_{u} \lambda \text { for } a_{u-1} \leqslant t \leqslant a_{u} \text { and } u \in[l] . \tag{31}
\end{equation*}
$$

Define wt: $\mathbb{B}^{\frac{\infty}{2}}(\lambda) \rightarrow P_{\text {af }}$ by wt $(\eta)=\bar{\eta}(1) \in P_{\mathrm{af}}$. Set

$$
\begin{equation*}
h_{i}^{\eta}(t)=\left\langle\alpha_{i}^{\vee}, \bar{\eta}(t)\right\rangle \text { for } 0 \leqslant t \leqslant 1, \quad m_{i}^{\eta}=\min \left\{h_{i}^{\eta}(t) \mid 0 \leqslant t \leqslant 1\right\} \tag{32}
\end{equation*}
$$

We define $e_{i} \eta, i \in I_{\mathrm{af}}$, as follows: if $m_{i}^{\eta}=0$, then we set $e_{i} \eta=\mathbf{0}$. If $m_{i}^{\eta} \leqslant-1$, then we set

$$
\left\{\begin{array}{l}
t_{1}=\min \left\{t \mid 0 \leqslant t \leqslant 1, h_{i}^{\eta}(t)=m_{i}^{\eta}\right\}  \tag{33}\\
t_{0}=\max \left\{t \mid 0 \leqslant t \leqslant t_{1}, h_{i}^{\eta}(t)=m_{i}^{\eta}+1\right\}
\end{array}\right.
$$

Let $1 \leqslant p \leqslant q \leqslant l$ be such that $a_{p-1} \leqslant t_{0}<a_{p}$ and $t_{1}=a_{q}$. Then we define

$$
\begin{align*}
& e_{i} \eta=\left(x_{1}, \ldots, x_{p}, r_{i} x_{p}, \ldots, r_{i} x_{q}, x_{q+1}, \ldots, x_{l}\right. \\
&\left.a_{0}, \ldots, a_{p-1}, t_{0}, a_{p}, \ldots, a_{q}=t_{1}, \ldots, a_{l}\right) \tag{34}
\end{align*}
$$

if $t_{0}=a_{p-1}$, then we drop $x_{p}$ and $a_{p-1}$, and if $r_{j} x_{q}=x_{q+1}$, then we drop $x_{q+1}$ and $a_{q}=t_{1}$.

Next, we define $f_{i} \eta, i \in I_{\mathrm{af}}$, as follows: if $m_{i}^{\eta}=h_{i}^{\eta}(1)$, then we set $f_{i} \eta=\mathbf{0}$. If $h_{i}^{\eta}(1)-m_{i}^{\eta} \geqslant 1$, then we set

$$
\left\{\begin{array}{l}
t_{0}=\max \left\{t \mid 0 \leqslant t \leqslant 1, h_{i}^{\eta}(t)=m_{i}^{\eta}\right\}  \tag{35}\\
t_{1}=\min \left\{t \mid t_{0} \leqslant t \leqslant 1, h_{i}^{\eta}(t)=m_{i}^{\eta}+1\right\}
\end{array}\right.
$$

Let $1 \leqslant p \leqslant q \leqslant l-1$ be such that $t_{0}=a_{p}$ and $a_{q}<t_{1} \leqslant a_{q+1}$. Then we define

$$
\begin{align*}
& f_{i} \eta=\left(x_{1}, \ldots, x_{p}, r_{i} x_{p+1}, \ldots, r_{i} x_{q+1}, x_{q+1}, \ldots, x_{l}\right. \\
& \left.a_{0}, \ldots, a_{p}=t_{0}, \ldots, a_{q}, t_{1}, a_{q+1}, \ldots, a_{l}\right) \tag{36}
\end{align*}
$$

if $t_{1}=a_{q+1}$, then we drop $x_{q+1}$ and $a_{q+1}$, and if $x_{p}=r_{i} x_{p+1}$, then we drop $x_{p}$ and $a_{p}=t_{0}$.

For $\eta \in \mathbb{B}^{\frac{\infty}{2}}(\lambda)$ and $i \in I_{\mathrm{af}}$, define

$$
\left\{\begin{array}{l}
\varepsilon_{i}(\eta)=-m_{i}^{\eta}  \tag{37}\\
\varphi_{i}(\eta)=h_{i}^{\eta}(1)-m_{i}^{\eta}
\end{array}\right.
$$

For $\eta=\left(x_{1}, x_{2}, \ldots, x_{l} ; \boldsymbol{a}\right) \in \mathbb{B}^{\frac{\infty}{2}}(\lambda)$, set $\kappa(\eta)=x_{l}$. Following [29, Equation (4.2.1)], for each $x \in\left(W^{J_{\lambda}}\right)_{\text {af }}$, set

$$
\begin{equation*}
\mathbb{B}_{\succeq x}^{\frac{\infty}{2}}(\lambda)=\left\{\left.\eta \in \mathbb{B}^{\frac{\infty}{2}}(\lambda) \right\rvert\, \kappa(\eta) \succeq x\right\} \tag{38}
\end{equation*}
$$

Following [11, Equation (7.2.2)], we define an extremal element $\eta_{\rho} \in \mathbb{B}^{\frac{\infty}{2}}(\lambda)$ of weight $\lambda+\operatorname{wt}(\boldsymbol{\rho})$ for each $\boldsymbol{\rho}=\left(\rho^{(i)}\right)_{i \in I} \in \operatorname{Par}(\lambda)$, with $\rho^{(i)}=\left(\rho_{1}^{(i)} \geqslant \cdots \geqslant \rho_{m_{i}}^{(i)}=0\right)$. Let $s$ be the least common multiple of $\left\{m_{i} \mid i \in J_{\lambda}^{c}\right\}$. Let $c_{i}(\xi) \in \mathbb{Z}$ denote the coefficient of $\alpha_{i}^{\vee}$ in $\xi \in Q^{\vee}$. For $\xi, \zeta \in Q^{\vee}$, write $\xi \succ \zeta$ if $\xi \succeq \zeta$ and $\xi \neq \zeta$. Let $\zeta_{1}, \ldots, \zeta_{s} \in Q^{\vee}$ be such that
(i) $c_{i}\left(\zeta_{t}\right)=\rho_{u}^{(i)}$ if $i \in J_{\lambda}^{c}$ and $\frac{s(u-1)}{m_{i}}<t \leqslant \frac{s u}{m_{i}}$, and
(ii) $c_{j}\left(\zeta_{t}\right)=0$ for all $j \in J_{\lambda}$ and $t \in[s]$;
note that $\zeta_{1} \succeq \cdots \succeq \zeta_{s}$ and $\zeta_{s}=0$. Assume that

$$
\begin{equation*}
\zeta_{1}=\cdots=\zeta_{s_{1}} \succ \zeta_{s_{1}+1}=\cdots=\zeta_{s_{2}} \succ \cdots \cdots \succ \zeta_{s_{k-1}+1}=\cdots=\zeta_{s_{k}} \tag{39}
\end{equation*}
$$

where $1 \leqslant s_{1}<\cdots<s_{k-1}<s_{k}=s$. Set

$$
\begin{equation*}
\eta_{\rho}=\left(T_{\zeta_{s_{1}}}^{J_{\lambda}}, T_{\zeta_{s_{2}}}^{J_{\lambda}}, \ldots, T_{\zeta_{s_{k-1}}}^{J_{\lambda}}, e ; 0, \frac{s_{1}}{s}, \frac{s_{2}}{s}, \ldots, \frac{s_{k-1}}{s}, 1\right) . \tag{40}
\end{equation*}
$$

Theorem 2.9 ([11, Theorem 3.2.1 and Proposition 7.2.1]). Let $\lambda \in P^{+}$.
(1) For each connected component $C$ of (the crystal graph of) $\mathbb{B}^{\frac{\infty}{2}}(\lambda)$, there exists a unique $\boldsymbol{\rho} \in \operatorname{Par}(\lambda)$ such that $\eta_{\boldsymbol{\rho}} \in C$.
(2) There exists a unique isomorphism $\varphi_{\lambda}: \mathcal{B}(\lambda) \rightarrow \mathbb{B}^{\frac{\infty}{2}}(\lambda)$ of $\mathbf{U}$-crystals sending $S_{\boldsymbol{\rho}}^{-} u_{\lambda}$ to $\eta_{\boldsymbol{\rho}}$ for every $\boldsymbol{\rho} \in \operatorname{Par}(\lambda)$.

Remark 2.10. Let $\lambda \in P^{+}$.
(1) Since $\mathcal{B}(\lambda)$ is a regular U-crystal, it follows from Theorem 2.9 (2) that $\mathbb{B}^{\frac{\infty}{2}}(\lambda)$ is also a regular U-crystal. Hence $W_{\text {af }}$ acts on $\mathbb{B}^{\frac{\infty}{2}}(\lambda)$ as (12). By (40) and [29, Remark 3.5.2 (2)],

$$
\begin{equation*}
S_{x} \eta_{\rho}=\left(\Pi^{J_{\lambda}}\left(x T_{\zeta_{s_{1}}}^{J_{\lambda}}\right), \ldots, \Pi^{J_{\lambda}}\left(x T_{\zeta_{s_{k-1}}}^{J_{\lambda}}\right), \Pi^{J_{\lambda}}(x) ; 0, \frac{s_{1}}{s}, \ldots, \frac{s_{k-1}}{s}, 1\right) \tag{41}
\end{equation*}
$$

for $\boldsymbol{\rho} \in \operatorname{Par}(\lambda)$ and $x \in W_{\mathrm{af}}$.
(2) Let $\mathcal{B}_{x}^{-}(\lambda)$ be the (opposite) Demazure subcrystal of $\mathcal{B}(\lambda)$ associated with $x \in\left(W^{J_{\lambda}}\right)_{\mathrm{af}}([29, \S 4.1]$; see also $[17, \S 2.8])$. We know from [29, Theorem 4.2.1] that $\varphi_{\lambda}\left(\mathcal{B}_{x}^{-}(\lambda)\right)=\mathbb{B}_{\succeq x}^{\frac{\infty}{2}}(\lambda)$. However, we will not use this fact in any essential way in the remainder of this paper.

## 3. Deodhar-type criterion for semi-infinite Bruhat order

This section is devoted to the proof of the next theorem.
Theorem 3.1. Let $J, K_{1}, K_{2}, \ldots, K_{s} \subset I$ be such that $J=\bigcap_{\nu=1}^{s} K_{\nu}$, and let $x, y \in$ $\left(W^{J}\right)_{\mathrm{af}}$. We have $x \succeq y$ in $\left(W^{J}\right)_{\mathrm{af}}$ if and only if $\Pi^{K_{\nu}}(x) \succeq \Pi^{K_{\nu}}(y)$ in $\left(W^{K_{\nu}}\right)_{\mathrm{af}}$ for all $\nu \in[s]$.

This theorem is an analogue of Deodhar's criterion for Bruhat order on Coxeter groups ([4, Theorem 2.6.1]; see also [8, Lemma 3.6]). It is easily seen that Theorem 3.1 is equivalent to the next proposition.

Proposition 3.2. Let $J \subset I$ and $x, y \in\left(W^{J}\right)_{\mathrm{af}}$. We have $x \succeq y$ in $\left(W^{J}\right)_{\mathrm{af}}$ if and only if $\Pi^{I \backslash\{i\}}(x) \succeq \Pi^{I \backslash\{i\}}(y)$ in $\left(W^{I \backslash\{i\}}\right)_{\text {af }}$ for all $i \in I \backslash J$.

We give a proof of Proposition 3.2 in $\S 3.3$. For this purpose, we first introduce an isomorphism $\psi_{\lambda}: \mathbb{B}^{\frac{\infty}{2}}(\lambda) \rightarrow \bigotimes_{i \in J_{\lambda}^{c}} \mathbb{B}^{\frac{\infty}{2}}\left(m_{i} \varpi_{i}\right)$ of $\mathbf{U}$-crystals in $\S 3.1$. Next, in Proposition 3.4 , we give a partial characterization of the image of $\mathbb{B}_{\succeq x}^{\frac{\infty}{2}}(\lambda), x \in\left(W^{J_{\lambda}}\right)_{\mathrm{af}}$, under the map $\psi_{\lambda}$. Finally, we show that Proposition 3.4 (2) implies Proposition 3.2.
3.1. The map $\psi_{\lambda}$ and Demazure crystals. In this subsection, we give a partial characterization of the image of $\mathbb{B}_{\succeq x}^{\frac{\infty}{2}}(\lambda)$ under the isomorphism $\psi_{\lambda}: \mathbb{B}^{\frac{\infty}{2}}(\lambda) \rightarrow$ $\bigotimes_{i \in J_{\lambda}^{c}} \mathbb{B} \frac{\infty}{2}\left(m_{i} \varpi_{i}\right)$ of $\mathbf{U}$-crystals obtained in the next lemma.

Lemma 3.3 (cf. Theorem 2.8). Let $\lambda=\sum_{i \in I} m_{i} \varpi_{i} \in P^{+}$. There exists a unique isomorphism $\psi_{\lambda}: \mathbb{B}^{\frac{\infty}{2}}(\lambda) \rightarrow \bigotimes_{i \in J_{\lambda}^{c}} \mathbb{B}^{\frac{\infty}{2}}\left(m_{i} \varpi_{i}\right)$ of $\mathbf{U}$-crystals such that

$$
\begin{equation*}
\psi_{\lambda}\left(\eta_{\rho}\right)=\bigotimes_{i \in J_{\lambda}^{c}} \eta_{\rho^{(i)}} \quad \text { for all } \boldsymbol{\rho}=\left(\rho^{(i)}\right) \in \operatorname{Par}(\lambda), \tag{42}
\end{equation*}
$$

where, for each $i \in J_{\lambda}^{c}, \eta_{\rho^{(i)}} \in \mathbb{B}^{\frac{\infty}{2}}\left(m_{i} \varpi_{i}\right)$ denotes the element (40) associated with $\rho^{(i)} \in \operatorname{Par}\left(m_{i} \varpi_{i}\right)$.

Proof. We first claim that there exists a unique strict embedding $\breve{\psi}_{\lambda}: \mathbb{B}^{\frac{\infty}{2}}(\lambda) \rightarrow$ $\bigotimes_{i \in J_{\lambda}^{c}} \mathbb{B}^{\frac{\infty}{2}}\left(\varpi_{i}\right)^{\otimes m_{i}}$ of $\mathbf{U}$-crystals such that

$$
\begin{equation*}
\breve{\psi}_{\lambda}\left(\eta_{\rho}\right)=\bigotimes_{i \in J_{\lambda}^{c}} \bigotimes_{\nu=1}^{m_{i}}\left(T_{\rho_{\nu}^{(i)} \alpha_{i}^{\wedge}}^{I \backslash\{i\}} ; 0,1\right) \tag{43}
\end{equation*}
$$

for all $\boldsymbol{\rho}=\left(\rho_{1}^{(i)} \geqslant \rho_{2}^{(i)} \geqslant \cdots \geqslant \rho_{m_{i}-1}^{(i)} \geqslant \rho_{m_{i}}^{(i)}=0\right)_{i \in I} \in \operatorname{Par}(\lambda)$; the uniqueness follows from Theorem 2.9 (1). Indeed, we see from (28) and [10, Lemma 3.8 (1)] that the map

$$
\begin{equation*}
\breve{\psi}_{\lambda}:=\left(\bigotimes_{i \in J_{\lambda}^{c}} \varphi_{\varpi_{i}}^{\otimes m_{i}}\right) \circ \Phi_{\lambda \mid q=0}^{\mathrm{LT}} \circ \varphi_{\lambda}^{-1}: \mathbb{B}^{\frac{\infty}{2}}(\lambda) \rightarrow \bigotimes_{i \in J_{\lambda}^{c}} \mathbb{B}^{\frac{\infty}{2}}\left(\varpi_{i}\right)^{\otimes m_{i}} \tag{44}
\end{equation*}
$$

is a strict embedding satisfying (43). We can now construct the map $\psi_{\lambda}$ as follows. By (43) and Theorem 2.9 (1), the image of $\breve{\psi}_{\lambda}$ equals that of $\bigotimes_{i \in J_{\lambda}^{c}} \breve{\psi}_{m_{i} \varpi_{i}}$. Hence the map

$$
\begin{equation*}
\psi_{\lambda}:=\left(\bigotimes_{i \in J_{\lambda}^{c}} \breve{\psi}_{m_{i} \varpi_{i}}\right)^{-1} \circ \breve{\psi}_{\lambda}: \mathbb{B}^{\frac{\infty}{2}}(\lambda) \rightarrow \bigotimes_{i \in J_{\lambda}^{c}} \mathbb{B}^{\frac{\infty}{2}}\left(m_{i} \varpi_{i}\right) \tag{45}
\end{equation*}
$$

is well-defined and satisfies (42); the uniqueness follows from Theorem 2.9 (1).
For $\lambda=\sum_{i \in I} m_{i} \varpi_{i} \in P^{+}$and $x \in\left(W^{J_{\lambda}}\right)_{\mathrm{af}}$, set

$$
\begin{align*}
\bigotimes_{i \in J_{\lambda}^{c}} & \mathbb{B}_{\succeq \Pi^{I \backslash\{i\}}(x)}^{\frac{\infty}{2}}\left(m_{i} \varpi_{i}\right) \\
& =\left\{\bigotimes_{i \in J_{\lambda}^{c}} \eta^{(i)} \in \bigotimes_{i \in J_{\lambda}^{c}} \mathbb{B}^{\infty}\left(m_{i} \varpi_{i}\right) \mid \kappa\left(\eta^{(i)}\right) \succeq \Pi^{I \backslash\{i\}}(x) \text { for all } i \in J_{\lambda}^{c}\right\} . \tag{46}
\end{align*}
$$

Proposition 3.4. Let $\lambda=\sum_{i \in I} m_{i} \varpi_{i} \in P^{+}$and $x \in\left(W^{J_{\lambda}}\right)_{\mathrm{af}}$.
(1) $\psi_{\lambda}\left(\mathbb{B}_{\succeq x}^{\frac{\infty}{2}}(\lambda)\right) \subset \bigotimes_{i \in J_{\lambda}^{c}} \mathbb{B}_{\succeq \Pi^{I \backslash\{i\}}(x)}^{\frac{\infty}{2}}\left(m_{i} \varpi_{i}\right)$.
(2) If $\pi \in \bigotimes_{i \in J_{\lambda}^{c}} \mathbb{B}_{\succeq \Pi^{I \backslash\{i\}}(x)}^{\frac{\infty}{2}}\left(m_{i} \varpi_{i}\right)$ is of the form

$$
\begin{align*}
& \quad \pi=\bigotimes_{i \in J_{\lambda}^{c}} S_{y} \eta_{\rho^{(i)}} \text { for some } y \in W_{\mathrm{af}} \text { and }\left(\rho^{(i)}\right) \in \operatorname{Par}(\lambda),  \tag{47}\\
& \text { then } \pi \in \psi_{\lambda}\left(\mathbb{B}_{\succeq x}^{\frac{\infty}{2}}(\lambda)\right) .
\end{align*}
$$

Remark 3.5. It follows from (43), [1, Lemma 1.6 (2)] and [16, Proposition 5.4 (i)] that an element $\pi \in \mathbb{B}^{\frac{\infty}{2}}(\lambda)$ is extremal if and only if $\pi$ is of the form (47).
3.2. Proof of Proposition 3.4. This subsection is devoted to the proof of Proposition 3.4. We begin by recalling some fundamental properties of $\mathbb{B}^{\frac{\infty}{2}}(\lambda)$.

Lemma 3.6. Let $\lambda \in P^{+}$and $\boldsymbol{\rho} \in \operatorname{Par}(\lambda)$.
(1) $\kappa\left(S_{x} \eta_{\rho}\right)=\Pi^{J_{\lambda}}(x)$ for $x \in W_{\mathrm{af}}$.
(2) $\left(W_{J_{\lambda}}\right)_{\mathrm{af}}=\left\{x \in W_{\mathrm{af}} \mid S_{x} \eta_{\rho}=\eta_{\rho}\right\}$.

Proof. (1) follows from (41).

By (40)-(41), $S_{x} \eta_{\rho}=\eta_{\rho}$ if and only if $\Pi^{J_{\lambda}}\left(x T_{\zeta_{s_{p}}}^{J_{\lambda}}\right)=T_{\zeta_{s_{p}}}^{J_{\lambda}}$ for $p \in[k]$. By Lemma 2.3 (2),

$$
\begin{aligned}
\Pi^{J_{\lambda}}\left(x T_{\zeta_{s_{p}}}^{J_{\lambda}}\right) & =\Pi^{J_{\lambda}}\left(x \Pi^{J_{\lambda}}\left(t_{\zeta_{s_{p}}}\right)\right)=\Pi^{J_{\lambda}}\left(x t_{\zeta_{s_{p}}}\right) \\
& =\Pi^{J_{\lambda}}(x) \Pi^{J_{\lambda}}\left(t_{\zeta_{s_{p}}}\right)=\Pi^{J_{\lambda}}(x) T_{\zeta_{s_{p}}}^{J_{\lambda}}
\end{aligned}
$$

for $p \in[k]$. This implies that $S_{x} \eta_{\rho}=\eta_{\rho}$ if and only if $\Pi^{J_{\lambda}}(x)=e$, or equivalently, $x \in\left(W_{J_{\lambda}}\right)_{\mathrm{af}}$.

Lemma $3.7([29, \S 5])$. Let $\lambda \in P^{+}$and $x, y \in\left(W^{J_{\lambda}}\right)_{\text {af }}$.
(1) $\mathbb{B}_{\underbrace{2}_{x}}^{\frac{\infty}{2}}(\lambda) \cup\{\mathbf{0}\}$ is stable under the action of $f_{j}$ for all $j \in I_{\mathrm{af}}$.
(2) $\mathbb{B}_{\succeq}^{\frac{\infty}{2}}(\lambda) \cup\{\mathbf{0}\}$ is stable under the action of $e_{j}$ for $j \in I_{\mathrm{af}}$ such that $\left\langle\alpha_{j}^{\vee}, x \lambda\right\rangle \geqslant 0$.
(3) $x \succeq y$ if and only if $\mathbb{B}_{\succeq x}^{\frac{\infty}{2}}(\lambda) \subset \mathbb{B}_{\succeq y}^{\frac{\infty}{2}}(\lambda)$.
(4) For every $\eta \in \mathbb{B}_{\succeq x}^{\frac{\infty}{2}}(\lambda)$, we have $f_{j}^{\max } \eta \in \mathbb{B}_{\succeq \Pi^{J_{\lambda}\left(r_{j} x\right)}}^{\frac{\infty}{2}}(\lambda)$ for all $j \in I_{\mathrm{af}}$.

The next lemma is a slight refinement of [29, Lemma 5.4.1].
Lemma 3.8. For $\eta \in \mathbb{B}^{\frac{\infty}{2}}(\lambda)\left(\right.$ resp. $\left.\eta \in \bigotimes_{i \in J_{\lambda}^{c}} \mathbb{B}^{\frac{\infty}{2}}\left(m_{i} \varpi_{i}\right)\right), x \in W_{\mathrm{af}}$ and $w \in W$, there exist $i_{1}, i_{2}, \ldots, i_{N} \in I_{\text {af }}$ such that
(i) $\left\langle\alpha_{i_{n}}^{\vee}, r_{i_{n-1}} \cdots r_{i_{2}} r_{i_{1}} x \lambda\right\rangle \geqslant 0$ for all $n \in[N]$, and
(ii) $f_{i_{N}}^{\max } \cdots f_{i_{2}}^{\max } f_{i_{1}}^{\max } \eta=S_{w t_{\xi}} \eta_{\rho}\left(\right.$ resp. $\left.f_{i_{N}}^{\max } \cdots f_{i_{2}}^{\max } f_{i_{1}}^{\max } \eta=\bigotimes_{i \in J_{\lambda}^{c}} S_{w t_{\xi}} \eta_{\rho^{(i)}}\right)$ for some $\xi \in Q^{\vee}$ and $\boldsymbol{\rho}=\left(\rho^{(i)}\right)_{i \in J_{\lambda}^{c}} \in \operatorname{Par}(\lambda)$.

Proof. By Lemma 3.3, it suffices to prove the assertion only for $\mathbb{B}^{\frac{\infty}{2}}(\lambda)$. By [29, Lemma 5.4.1], there exist $j_{1}, j_{2}, \ldots, j_{p} \in I_{\mathrm{af}}$ such that
(i) $\left\langle\alpha_{j_{m}}^{\vee}, r_{j_{m-1}} \cdots r_{j_{2}} r_{j_{1}} x \lambda\right\rangle \geqslant 0$ for all $m \in[p]$, and
(ii) $f_{j_{p}}^{\max } \cdots f_{j_{2}}^{\max } f_{j_{1}}^{\max } \eta=S_{t_{\xi}} \eta_{\boldsymbol{\rho}}$ for some $\xi \in Q^{\vee}$ and $\boldsymbol{\rho} \in \operatorname{Par}(\lambda)$.

We see from (the proof of) [29, Lemma 5.4.1] that

$$
r_{j_{p}} \cdots r_{j_{2}} r_{j_{1}} x \lambda \equiv \lambda \quad \bmod \mathbb{C} \delta
$$

For a reduced expression $w=r_{k_{q}} r_{k_{q-1}} \cdots r_{k_{1}}, k_{1}, k_{2}, \ldots, k_{q} \in I$, we have

$$
\left\langle\alpha_{k_{m}}^{\vee}, r_{k_{m-1}}^{\vee} \cdots r_{k_{2}} r_{k_{1}} r_{j_{p}} \cdots r_{j_{2}} r_{j_{1}} x \lambda\right\rangle=\left\langle\alpha_{k_{m}}^{\vee}, r_{k_{m-1}} \cdots r_{k_{2}} r_{k_{1}} \lambda\right\rangle \geqslant 0
$$

for all $m \in[q]$. It follows from $\operatorname{wt}\left(S_{t_{\xi}} \eta_{\rho}\right) \equiv \lambda \bmod \mathbb{C} \delta$ and Lemma 2.1 (1) that

$$
f_{k_{q}}^{\max } \cdots f_{k_{2}}^{\max } f_{k_{1}}^{\max } \underbrace{f_{j_{p}}^{\max } \cdots f_{j_{2}}^{\max } f_{j_{1}}^{\max } \eta}_{=S_{t_{\xi}} \eta_{\rho}}=S_{w} S_{t_{\xi}} \eta_{\rho}=S_{w t_{\xi}} \eta_{\rho} .
$$

This completes the proof.
We are now in a position to prove Proposition 3.4. In what follows, we write

$$
\begin{equation*}
\mathbb{B}_{\succeq x}=\mathbb{B}_{\succeq x}^{\frac{\infty}{2}}(\lambda) \text { and } \breve{\mathbb{B}}_{\succeq x}=\bigotimes_{i \in J_{\lambda}^{c}} \mathbb{B}_{\succeq \Pi^{I \backslash\{i\}}(x)}^{\frac{\infty}{2}}\left(m_{i} \varpi_{i}\right) \text { for } x \in\left(W^{J_{\lambda}}\right)_{\mathrm{af}} \tag{48}
\end{equation*}
$$

Proof of Proposition 3.4 (1). To see $\psi_{\lambda}\left(\mathbb{B}_{\succeq x}\right) \subset \breve{\mathbb{B}}_{\succeq x}$, let $\eta \in \mathbb{B}_{\succeq x}$, and show that $\psi_{\lambda}(\eta) \in \breve{\mathbb{B}}_{\succeq x}$. By Lemma 3.8, there exist $i_{1}, i_{2}, \ldots, i_{N} \in I_{\mathrm{af}}$ such that
(i) $\left\langle\alpha_{i_{n}}^{\vee}, r_{i_{n-1}} r_{i_{n-2}} \cdots r_{i_{1}} x \lambda\right\rangle \geqslant 0$ for all $n \in[N]$, and
(ii) $f_{i_{N}}^{\max } \cdots f_{i_{2}}^{\max } f_{i_{1}}^{\max } \eta=S_{t_{\xi}} \eta_{\rho}$ for some $\xi \in Q^{\vee}$ and $\boldsymbol{\rho} \in \operatorname{Par}(\lambda)$.

The proof is by induction on $N$.
If $N=0$, then $\eta=S_{t_{\xi}} \eta_{\rho}$ and

$$
\psi_{\lambda}(\eta)=\psi_{\lambda}\left(S_{t_{\xi}} \eta_{\rho}\right)=S_{t_{\xi}} \psi_{\lambda}\left(\eta_{\rho}\right)=S_{t_{\xi}} \bigotimes_{i \in J_{\lambda}^{c}} \eta_{\rho^{(i)}}=\bigotimes_{i \in J_{\lambda}^{c}} S_{t_{\xi}} \eta_{\rho^{(i)}}
$$

by Lemmas 2.1 (2) and 3.3. By Lemma 3.6 (1), $\kappa\left(S_{t_{\xi}} \eta_{\rho^{(i)}}\right)=\Pi^{I \backslash\{i\}}\left(t_{\xi}\right)$ for all $i \in J_{\lambda}^{c}$. Since $\Pi^{J_{\lambda}}\left(t_{\xi}\right)=\kappa(\eta) \succeq x$, it follows from Lemma 2.4 (1) that

$$
\begin{equation*}
\Pi^{I \backslash\{i\}}\left(t_{\xi}\right)=\Pi^{I \backslash\{i\}}\left(\Pi^{J_{\lambda}}\left(t_{\xi}\right)\right) \succeq \Pi^{I \backslash\{i\}}(x) \text { for all } i \in J_{\lambda}^{c} \tag{49}
\end{equation*}
$$

Hence $\kappa\left(S_{t_{\xi}} \eta_{\rho^{(i)}}\right) \succeq \Pi^{I \backslash\{i\}}(x)$ for all $i \in J_{\lambda}^{c}$, which implies $\psi_{\lambda}(\eta) \in \breve{\mathbb{B}}_{\succeq x}$.
If $N>0$, then $f_{i_{1}}^{\max } \eta \in \mathbb{B}_{\succeq \Pi^{J_{\lambda}}\left(r_{i_{1}} x\right)}$ by Lemma 3.7 (4). By induction hypothesis, $\psi_{\lambda}\left(f_{i_{1}}^{\max } \eta\right) \in \breve{\mathbb{B}}_{\succeq \Pi^{J_{\lambda}\left(r_{i_{1}} x\right)}}$. We claim that $\psi_{\lambda}\left(f_{i_{1}}^{\max } \eta\right) \in \breve{\mathbb{B}}_{\succeq x}$. Indeed, since $\left\langle\alpha_{i_{1}}^{\vee}, x \lambda\right\rangle \geqslant$ 0 (see (i) above), Lemma 2.5 (2)-(3) gives $\Pi^{J_{\lambda}}\left(r_{i_{1}} x\right) \succeq x$. By Lemma 2.4 (1),

$$
\begin{equation*}
\Pi^{I \backslash\{i\}}\left(r_{i_{1}} x\right)=\Pi^{I \backslash\{i\}}\left(\Pi^{J_{\lambda}}\left(r_{i_{1}} x\right)\right) \succeq \Pi^{I \backslash\{i\}}(x) \text { for all } i \in J_{\lambda}^{c} . \tag{50}
\end{equation*}
$$

Lemma 3.7 (3) now shows that $\breve{\mathbb{B}}_{\succeq \Pi^{J}\left(r_{i_{1}} x\right)} \subset \breve{\mathbb{B}}_{\succeq x}$, and hence $\psi_{\lambda}\left(f_{i_{1}}^{\max } \eta\right) \in \breve{\mathbb{B}}_{\succeq x}$. Since $\psi_{\lambda}$ is an isomorphism of $\mathbf{U}$-crystals, there exists $k \in \mathbb{Z}_{\geqslant 0}$ such that $\psi_{\lambda}(\eta)=$ $e_{i_{1}}^{k} \psi_{\lambda}\left(f_{i_{1}}^{\max } \eta\right)$. We see from $\Pi^{I \backslash\{i\}}\left(r_{i_{1}} x\right) \succeq \Pi^{I \backslash\{i\}}(x)$ and Lemma 2.5 (2)-(3) that

$$
\begin{equation*}
\left\langle\alpha_{i_{1}}^{\vee}, \Pi^{I \backslash\{i\}}(x) m_{i} \varpi_{i}\right\rangle=m_{i}\left\langle\alpha_{i_{1}}^{\vee}, \Pi^{I \backslash\{i\}}(x) \varpi_{i}\right\rangle \geqslant 0 \text { for all } i \in J_{\lambda}^{c} \tag{51}
\end{equation*}
$$

By Lemma 3.7 (2) and tensor product rule, we conclude that $\psi_{\lambda}(\eta)=e_{i_{1}}^{k} \psi_{\lambda}\left(f_{i_{1}}^{\max } \eta\right) \in$ $\breve{\mathbb{B}}_{\succeq x}$.

Proof of Proposition 3.4 (2). Assume that $\pi=\bigotimes_{i \in J_{\lambda}^{c}} S_{y} \eta_{\rho^{(i)}} \in \breve{\mathbb{B}}_{\succeq x}, y \in W_{\mathrm{af}}$ and $\boldsymbol{\rho}=\left(\rho^{(i)}\right) \in \operatorname{Par}(\lambda)$. By Lemmas 2.1 (2) and 3.3,

$$
\begin{equation*}
\pi=\bigotimes_{i \in J_{\lambda}^{c}} S_{y} \eta_{\rho^{(i)}}=S_{y} \bigotimes_{i \in J_{\lambda}^{c}} \eta_{\rho^{(i)}}=S_{y} \psi_{\lambda}\left(\eta_{\rho}\right)=\psi_{\lambda}\left(S_{y} \eta_{\rho}\right) \tag{52}
\end{equation*}
$$

Let $w_{0} \in W$ be the longest element. By Lemma 3.8, there exist $i_{1}, i_{2}, \ldots, i_{N} \in I_{\mathrm{af}}$ such that
(i) $\left\langle\alpha_{i_{n}}^{\vee}, r_{i_{n-1}} r_{i_{n-2}} \cdots r_{i_{1}} x \lambda\right\rangle \geqslant 0$ for all $n \in[N]$, and
(ii) $f_{i_{N}}^{\max } \cdots f_{i_{2}}^{\max } f_{i_{1}}^{\max } \pi=\bigotimes_{i \in J_{\lambda}^{c}} S_{w_{0} t_{\xi}} \eta_{\rho^{(i)}}$ for some $\xi \in Q^{\vee}$.

We show by induction on $N$ that $\pi \in \psi_{\lambda}\left(\mathbb{B}_{\succeq x}\right)$, or equivalently, $\kappa\left(S_{y} \eta_{\rho}\right) \succeq x$; note that $\kappa\left(S_{y} \eta_{\rho}\right)=\Pi^{J_{\lambda}}(y)$ by Lemma 3.6 (1).

We first assume that $N=0$. In the same manner as in (52) we see that $\pi=$ $\psi_{\lambda}\left(S_{w_{0} t_{\xi}} \eta_{\rho}\right)$. Since $\psi_{\lambda}$ is an isomorphism of U-crystals, we have $S_{y} \eta_{\rho}=S_{w_{0} t_{\xi}} \eta_{\rho}$, and hence $\Pi^{J_{\lambda}}(y)=\Pi^{J_{\lambda}}\left(w_{0} t_{\xi}\right)$ by Lemma 3.6 (1). Write $x=w t_{\zeta}, w \in W, \zeta \in Q^{\vee}$. We proceed by induction on $\ell\left(w_{0}\right)-\ell(w)$.

If $\ell\left(w_{0}\right)-\ell(w)=0$, then $w=w_{0}$. By Lemma 3.6 (1),

$$
\begin{equation*}
\Pi^{I \backslash\{i\}}\left(w_{0} t_{\xi}\right)=\Pi^{I \backslash\{i\}}(y)=\kappa\left(S_{y} \eta_{\rho^{(i)}}\right) \text { for all } i \in J_{\lambda}^{c} \tag{53}
\end{equation*}
$$

Since $\pi \in \breve{\mathbb{B}}_{\succeq}$, we have

$$
\begin{equation*}
\kappa\left(S_{y} \eta_{\rho^{(i)}}\right) \succeq \Pi^{I \backslash\{i\}}(x)=\Pi^{I \backslash\{i\}}\left(w t_{\zeta}\right)=\Pi^{I \backslash\{i\}}\left(w_{0} t_{\zeta}\right) \text { for all } i \in J_{\lambda}^{c} \tag{54}
\end{equation*}
$$

Hence $\Pi^{I \backslash\{i\}}\left(w_{0} t_{\xi}\right) \succeq \Pi^{I \backslash\{i\}}\left(w_{0} t_{\zeta}\right)$ for all $i \in J_{\lambda}^{c}$. By Lemma 2.7, we have $\Pi^{I \backslash\{i\}}\left(t_{\xi}\right) \succeq \Pi^{I \backslash\{i\}}\left(t_{\zeta}\right)$ for all $i \in J_{\lambda}^{c}$, which implies $\Pi^{J_{\lambda}}\left(t_{\xi}\right) \succeq \Pi^{J_{\lambda}}\left(t_{\zeta}\right)$, by Lemma 2.4 (2). Again, by Lemma 2.7, we have $\Pi^{J_{\lambda}}\left(w_{0} t_{\xi}\right) \succeq \Pi^{J_{\lambda}}\left(w_{0} t_{\zeta}\right)$. Since $\kappa\left(S_{y} \eta_{\rho}\right)=\Pi^{J_{\lambda}}(y)=\Pi^{J_{\lambda}}\left(w_{0} t_{\xi}\right)$ and $x=\Pi^{J_{\lambda}}\left(w_{0} t_{\zeta}\right)$, we conclude that $\kappa\left(S_{y} \eta_{\rho}\right) \succeq x$.

If $\ell\left(w_{0}\right)-\ell(w)>0$, then $w \neq w_{0}$. There exists $j \in I$ such that $r_{j} x \succeq x$; note that $r_{j} x=r_{j} w t_{\zeta}, r_{j} w \in W$, and $\ell\left(w_{0}\right)-\ell\left(r_{j} w\right)<\ell\left(w_{0}\right)-\ell(w)$. Since $\left\langle\alpha_{j}^{\vee}, \Pi^{J_{\lambda}}(y) \lambda\right\rangle=$
$\left\langle\alpha_{j}^{\vee}, w_{0} t_{\xi} \lambda\right\rangle \leqslant 0$ by Lemma 2.2, we have $\Pi^{J_{\lambda}}(y) \succeq \Pi^{J_{\lambda}}\left(r_{j} y\right)$ by Lemma 2.5. By Lemma 2.4 (1),

$$
\begin{equation*}
\Pi^{I \backslash\{i\}}\left(r_{j} x\right) \succeq \Pi^{I \backslash\{i\}}(x) \text { and } \Pi^{I \backslash\{i\}}(y) \succeq \Pi^{I \backslash\{i\}}\left(r_{j} y\right) \text { for all } i \in J_{\lambda}^{c} \tag{55}
\end{equation*}
$$

Since $\pi \in \breve{\mathbb{B}}_{\succeq x}$, we have $\Pi^{I \backslash\{i\}}(y)=\kappa\left(S_{y} \eta_{\rho^{(i)}}\right) \succeq \Pi^{I \backslash\{i\}}(x)$ for all $i \in J_{\lambda}^{c}$. It follows from Lemma 2.6 (1) that $\Pi^{I \backslash\{i\}}(y) \succeq \Pi^{I \backslash\{i\}}\left(r_{j} x\right)$ for all $i \in J_{\lambda}^{c}$. By induction hypothesis, we have $\Pi^{J_{\lambda}}(y) \succeq \Pi^{J_{\lambda}}\left(r_{j} x\right)$. We see from $\Pi^{I \backslash\{i\}}\left(r_{j} x\right) \succeq \Pi^{I \backslash\{i\}}(x), i \in$ $J_{\lambda}^{c}$, Lemmas 2.2 and $2.5(2)-(3)$ that $\left\langle\alpha_{j}^{\vee}, x \varpi_{i}\right\rangle=\left\langle\alpha_{j}^{\vee}, \Pi^{I \backslash\{i\}}(x) \varpi_{i}\right\rangle \geqslant 0$ for all $i \in J_{\lambda}^{c}$, which gives $\left\langle\alpha_{j}^{\vee}, x \lambda\right\rangle=\sum_{i \in J_{\lambda}^{c}} m_{i}\left\langle\alpha_{j}^{\vee}, x \varpi_{i}\right\rangle \geqslant 0$. Again, by Lemma 2.5 (2)-(3), we have $\Pi^{J_{\lambda}}\left(r_{j} x\right) \succeq x$. Thus $\kappa\left(S_{y} \eta_{\rho}\right)=\Pi^{J_{\lambda}}(y) \succeq x$.

We next assume that $N>0$. It follows from Lemmas 2.1 and 3.7 (4) that

$$
\begin{equation*}
f_{i_{1}}^{\max } \pi=f_{i_{1}}^{\max } \bigotimes_{i \in J_{\lambda}^{c}} S_{y} \eta_{\rho^{(i)}}=\bigotimes_{i \in J_{\lambda}^{c}} \underbrace{f_{i_{1}}^{\max } S_{y} \eta_{\rho^{(i)}}}_{=S_{r_{i_{1}} y} \eta_{\rho^{(i)}}} \in \breve{\mathbb{B}}_{\succeq \Pi^{J_{\lambda}}\left(r_{i_{1}} x\right)} \tag{56}
\end{equation*}
$$

is of the form (47). By induction hypothesis, there exists $\eta \in \mathbb{B}_{\succeq \Pi^{J}{ }_{\lambda}\left(r_{i_{1}} x\right)}$ such that $f_{i_{1}}^{\max } \pi=\psi_{\lambda}(\eta)$. Since $\psi_{\lambda}$ is an isomorphism of $\mathbf{U}$-crystals, there exists $k \in \mathbb{Z}_{\geqslant 0}$ such that $\pi=\psi_{\lambda}\left(e_{i_{1}}^{k} \eta\right)$. We see from $\left\langle\alpha_{i_{1}}^{\vee}, x \lambda\right\rangle \geqslant 0$ (see (i) above) and Lemma 2.5 (2)-(3) that $\Pi^{J_{\lambda}}\left(r_{i_{1}} x\right) \succeq x$, which gives $\mathbb{B}_{\succeq \Pi^{J_{\lambda}\left(r_{i_{1}} x\right)}} \subset \mathbb{B}_{\succeq x}$, by Lemma 3.7 (3). It follows from $\left\langle\alpha_{i_{1}}^{\vee}, x \lambda\right\rangle \geqslant 0$ (see (i) above) and Lemma 3.7 (2) that

$$
\begin{align*}
e_{i_{1}}^{k} \eta & \in\left\{e_{i_{1}}^{k} \eta^{\prime} \mid \eta^{\prime} \in \mathbb{B}_{\succeq \Pi^{J}{ }_{\lambda}\left(r_{i_{1}} x\right)}\right\} \backslash\{\mathbf{0}\}  \tag{57}\\
& \subset\left\{e_{i_{1}}^{k} \eta^{\prime} \mid \eta^{\prime} \in \mathbb{B}_{\succeq x}\right\} \backslash\{\mathbf{0}\} \subset \mathbb{B}_{\succeq x} .
\end{align*}
$$

Thus $\pi=\psi_{\lambda}\left(e_{i_{1}}^{k} \eta\right) \in \psi_{\lambda}\left(\mathbb{B}_{\succeq x}\right)$.

### 3.3. Proof of Proposition 3.2.

Proof of Proposition 3.2. The "only if" part follows immediately from Lemma 2.4 (1). Let us show the "if" part. Let $\lambda=\sum_{i \in I} m_{i} \varpi_{i} \in P^{+}$be such that $J_{\lambda}=J$. Let $\boldsymbol{\rho}=\left(\rho^{(i)}\right) \in \operatorname{Par}(\lambda)$. Since $\kappa\left(S_{x} \eta_{\rho^{(i)}}\right)=\Pi^{I \backslash\{i\}}(x)$, by Lemma 3.6 (1), and $\Pi^{I \backslash\{i\}}(x) \succeq \Pi^{I \backslash\{i\}}(y)$ for all $i \in I \backslash J=J_{\lambda}^{c}$, it follows that $\bigotimes_{i \in J_{\lambda}^{c}} S_{x} \eta_{\rho^{(i)}} \in$ $\bigotimes_{i \in J_{\lambda}^{c}} \mathbb{B}_{\succeq \Pi^{I \backslash\{i\}}(y)}^{\frac{\infty}{2}}\left(m_{i} \varpi_{i}\right)$. Similarly to (52), we have $\bigotimes_{i \in J_{\lambda}^{c}} S_{x} \eta_{\rho^{(i)}}=\psi_{\lambda}\left(S_{x} \eta_{\rho}\right)$. By Proposition $3.4(2), S_{x} \eta_{\boldsymbol{\rho}} \in \mathbb{B}_{\succeq y}^{\frac{\infty}{2}}(\lambda)$, which implies $\kappa\left(S_{x} \eta_{\rho}\right) \succeq y$. Since $x=\kappa\left(S_{x} \eta_{\boldsymbol{\rho}}\right)$, by Lemma 3.6 (1), we conclude that $x \succeq y$.

## 4. Tableau criterion for semi-infinite Bruhat order

Proposition 3.2 shows that the study of semi-infinite Bruhat order on $W_{\mathrm{af}}$ is reduced to those on the sets $\left(W^{I \backslash\{i\}}\right)_{\mathrm{af}}, i \in I$, of "semi-infinite Grassmannian elements." In this section, we proceed with the study of semi-infinite Bruhat order on $\left(W^{I \backslash\{i\}}\right)_{\mathrm{af}}$, $i \in I$, for $W_{\text {af }}$ of type $A_{n-1}^{(1)}, B_{n}^{(1)}, C_{n}^{(1)}$, and $D_{n}^{(1)}$. The main results of this section are Theorems 4.9, 4.14, 4.22, and 4.38 (see also Definitions 4.7, 4.12, 4.20, and 4.36), which give combinatorial criteria for semi-infinite Bruhat order in terms of tableaux. In order to get these results, we give a complete classification of the edges in the quantum Bruhat graph QB ${ }^{I \backslash\{i\}}, i \in I$ (see $\S 4.2$ and Propositions 4.18, 4.26, and 4.42). For combinatorial descriptions of Bruhat order on finite Weyl groups of classical type, we refer the reader to $[4, \S 8]$.
4.1. Explicit Description of $\left(W^{J}\right)_{\mathrm{af}}$. In this subsection, following [24, §3], we give an explicit description of $\left(W^{J}\right)_{\text {af }}$ for later use.

We take and fix $J=\bigsqcup_{m=1}^{k} I_{m} \subset I$, where $I_{1}, I_{2}, \ldots, I_{k}$ are the sets of vertices of the connected components of the Dynkin diagram of $\Delta_{J}$; note that $\Delta_{J}=\bigsqcup_{m=1}^{k} \Delta_{I_{m}}$. Set $\left(I_{m}\right)_{\text {af }}=\{0\} \sqcup I_{m} \subset I_{\text {af }}, m \in[k]$. Set

$$
\begin{equation*}
Q^{\vee, J}=\left\{\xi \in Q^{\vee} \mid\langle\xi, \alpha\rangle \in\{-1,0\} \text { for all } \alpha \in \Delta_{J}^{+}\right\} \tag{58}
\end{equation*}
$$

Lemma 4.1 ([24, Equation (3.6)]). For each $\xi \in Q^{\vee}$ there exist a unique $\phi_{J}(\xi) \in Q_{J}^{\vee}$ and a unique $\left(j_{1}, j_{2}, \ldots, j_{k}\right) \in \prod_{m=1}^{k}\left(I_{m}\right)_{\text {af }}$ such that

$$
\begin{equation*}
\xi+\phi_{J}(\xi)+\sum_{m=1}^{k} \varpi_{j_{m}}^{\vee} \in \bigoplus_{i \in I \backslash J} \mathbb{Z} \varpi_{i}^{\vee} \tag{59}
\end{equation*}
$$

In particular, $\xi+\phi_{J}(\xi) \in Q^{\vee, J}$ for any $\xi \in Q^{\vee}$, and hence $Q^{\vee, J}$ is a complete system of coset representatives for $Q^{\vee} / Q_{J}^{\vee}$.

For a subset $K \subset I$, let $w_{0}^{K}$ be the longest element of $W_{K}$. For $j_{m} \in\left(I_{m}\right)_{\mathrm{af}}$, set

$$
\begin{equation*}
v_{j_{m}}^{I_{m}}=w_{0}^{I_{m}} w_{0}^{I_{m} \backslash\left\{j_{m}\right\}} \in W_{I_{m}} \subset W_{J} \tag{60}
\end{equation*}
$$

note that $v_{0}^{I_{m}}=e$. For $\xi \in Q^{\vee}$, define

$$
\begin{equation*}
z_{\xi}=z_{\xi}^{J}=v_{j_{1}}^{I_{1}} v_{j_{2}}^{I_{2}} \cdots v_{j_{k}}^{I_{k}} \in W_{J} \tag{61}
\end{equation*}
$$

where $\left(j_{1}, j_{2}, \ldots, j_{k}\right) \in \prod_{m=1}^{k}\left(I_{m}\right)_{\text {af }}$, satisfying (59) for $\xi$, is determined uniquely by Lemma 4.1; note that $z_{\xi}=z_{\zeta}$ if $\xi \equiv \zeta \bmod Q_{J}^{\vee}$.
Lemma 4.2 ([24, Lemma 3.7]). We have $T_{\xi}=\Pi^{J}\left(t_{\xi}\right)=z_{\xi} t_{\xi+\phi_{J}(\xi)}$ for every $\xi \in Q^{\vee}$. Therefore, by Lemma 2.3, $\Pi^{J}\left(w t_{\xi}\right)=\lfloor w\rfloor z_{\xi} t_{\xi+\phi_{J}(\xi)}$ for every $w \in W$ and $\xi \in Q$, and we have a bijection $W^{J} \times Q^{\vee, J} \rightarrow\left(W^{J}\right)_{\mathrm{af}},(w, \xi) \mapsto w T_{\xi}$. In particular,

$$
\begin{equation*}
\left(W^{J}\right)_{\mathrm{af}}=\left\{w T_{\xi}=w z_{\xi} t_{\xi} \mid w \in W^{J}, \xi \in Q^{\vee, J}\right\} \tag{62}
\end{equation*}
$$

4.2. Quantum Bruhat graphs. Following [24, §4] (see also [5]), define the (parabolic) quantum Bruhat graph $\mathrm{QB}^{J}$ to be the $\left(\Delta^{+} \backslash \Delta_{J}^{+}\right)$-colored directed graph with vertex set $W^{J}$ and edges of the form $w \xrightarrow{\gamma}\left\lfloor w r_{\gamma}\right\rfloor$ for $w \in W^{J}$ and $\gamma \in$ $\Delta^{+} \backslash \Delta_{J}^{+}$, where $\ell\left(\left\lfloor w r_{\gamma}\right\rfloor\right)-\ell(w)=1-2 \chi\left\langle\gamma^{\vee}, \rho-\rho_{J}\right\rangle$ and $\chi \in\{0,1\}$. We say that an edge $w \xrightarrow{\gamma}\left\lfloor w r_{\gamma}\right\rfloor$ in $\mathrm{QB}^{J}$ is Bruhat (resp. quantum) if $\ell\left(\left\lfloor w r_{\gamma}\right\rfloor\right)-\ell(w)=1$ (resp. $\left.\ell\left(\left\lfloor w r_{\gamma}\right\rfloor\right)-\ell(w)=1-2\left\langle\gamma^{\vee}, \rho-\rho_{J}\right\rangle\right)$. We see that if there exists a Bruhat edge $w \xrightarrow{\gamma}\left\lfloor w r_{\gamma}\right\rfloor$ in $\mathrm{QB}^{J}$, then $w r_{\gamma}=\left\lfloor w r_{\gamma}\right\rfloor \in W^{J}$. Note that $\mathrm{QB}^{J}$ does not define a partial order on $W^{J}$.
Lemma 4.3 ([11, Proposition A.1.2]). Let $w \in W^{J}, \xi \in Q^{\vee}$ and $\beta \in \Delta_{\text {af }}^{+}$. Write $\beta=w \gamma+\chi \delta$ with $\gamma \in \Delta$ and $\chi \in \mathbb{Z}_{\geqslant 0}$. Then $r_{\beta} w T_{\xi} \in\left(W^{J}\right)_{\text {af }}$ and there exists an edge $w T_{\xi} \xrightarrow{\beta} r_{\beta} w T_{\xi}$ in $\mathrm{SiB}^{J}$ if and only if $\gamma \in \Delta^{+} \backslash \Delta_{J}^{+}$and one of the following conditions holds:
(1) $\chi=0$ and $w \xrightarrow{\gamma} w r_{\gamma}$ is a Bruhat edge in $\mathrm{QB}^{J}$,
(2) $\chi=1$ and $w \xrightarrow{\gamma}\left\lfloor w r_{\gamma}\right\rfloor$ is a quantum edge in $\mathrm{QB}^{J}$;
in these cases, we have $r_{\beta} w T_{\xi}=\left\lfloor w r_{\gamma}\right\rfloor T_{\xi+\chi \gamma \vee}=\left\lfloor w r_{\gamma}\right\rfloor z_{\xi+\chi \gamma^{\vee}} t_{\xi+\chi \gamma^{\vee}+\phi_{J}\left(\xi+\chi \gamma^{\vee}\right)}$ and $c_{i}\left(\xi+\chi \gamma^{\vee}+\phi_{J}\left(\xi+\chi \gamma^{\vee}\right)\right)=c_{i}(\xi)+\chi c_{i}\left(\gamma^{\vee}\right)$ for all $i \in I \backslash J$.
Lemma 4.4 ([20, Proof of Theorem 10.16]). Let $w \in W^{J}$ and $\gamma \in \Delta^{+} \backslash \Delta_{J}^{+}$. There exists a quantum edge $w \xrightarrow{\gamma}\left\lfloor w r_{\gamma}\right\rfloor$ in $\mathrm{QB}^{J}$ if and only if $\ell\left(w r_{\gamma}\right)-\ell(w)=1-2\left\langle\gamma^{\vee}, \rho\right\rangle$ and $w r_{\gamma} t_{\gamma^{\vee}} \in\left(W^{J}\right)_{\mathrm{af}}$; note that $w r_{\gamma} t_{\gamma^{\vee}} \in\left(W^{J}\right)_{\text {af }}$ and Lemma 4.2 imply $\gamma^{\vee} \in$ $Q^{\vee, J} \cap\left(\Delta^{\vee,+} \backslash \Delta_{J}^{\vee,+}\right)$ and $\left\lfloor w r_{\gamma}\right\rfloor=w r_{\gamma} z_{\gamma^{\vee}}^{-1}$.

Lemma 4.5. Let $i \in I$ and $\gamma^{\vee} \in Q^{\vee, I \backslash\{i\}} \cap\left(\Delta^{\vee,+} \backslash \Delta_{I \backslash\{i\}}^{\vee,+}\right.$. We have $\left\langle\gamma^{\vee}, \rho-\rho_{I \backslash\{i\}}\right\rangle=$ $c_{i}\left(\gamma^{\vee}\right)\left\langle\alpha_{i}^{\vee}, \rho-\rho_{I \backslash\{i\}}\right\rangle=c_{i}\left(\gamma^{\vee}\right)\left(1-\left\langle\alpha_{i}^{\vee}, \rho_{I \backslash\{i\}}\right\rangle\right)$.
Proof. The assertion follows from $\left\langle\xi, \rho-\rho_{I \backslash\{i\}}\right\rangle=0$ for $\xi \in Q_{I \backslash\{i\}}^{\vee}, \gamma^{\vee} \equiv c_{i}\left(\gamma^{\vee}\right) \alpha_{i}^{\vee}$ $\bmod Q_{I \backslash\{i\}}^{\vee}$, and $\left\langle\alpha_{i}^{\vee}, \rho\right\rangle=1$.
4.3. Type $A_{n-1}^{(1)}$. Fix an integer $n \geqslant 2$. Set $I=[n-1]$. We assume that the labeling of the vertices of the Dynkin diagram of type $A_{n-1}$ is as follows.

Let $\varepsilon_{1}, \varepsilon_{2}, \ldots, \varepsilon_{n}$ be an orthonormal basis of an $n$-dimensional Euclidean space $\mathbb{R}^{n}$. Let $\Delta=\left\{ \pm\left(\varepsilon_{s}-\varepsilon_{t}\right) \mid s, t \in[n], s<t\right\}$ be a root system of type $A_{n-1}$, and let $\Pi=\left\{\alpha_{s}=\varepsilon_{s}-\varepsilon_{s+1} \mid s \in I\right\}$ be a simple root system of $\Delta$.

Let $W$ be the Weyl group of $\Delta$; note that $W$ can be described by $W=\mathfrak{S}([n])$ as the permutation group of $\left\{\varepsilon_{s} \mid s \in[n]\right\} \subset \mathbb{R}^{n}$. The longest element of $W$ is given by $u \mapsto n-u+1, u \in[n]$. Let $\operatorname{CST}_{A_{n-1}}\left(\varpi_{i}\right)$ be the family of $i$-element subsets of $[n]$. We identify $\mathrm{T}=\{\mathrm{T}(1)<\mathrm{T}(2)<\cdots<\mathrm{T}(i)\} \in \mathrm{CST}_{A_{n-1}}\left(\varpi_{i}\right)$ with the column-strict tableau

| $\mathrm{T}(1)$ |
| :---: |
| $\mathrm{T}(2)$ |
| $\vdots$ |
| $\mathrm{T}(i)$ |.

For $w \in W$, let $\mathrm{T}_{w}^{(i)} \in \operatorname{CST}_{A_{n-1}}\left(\varpi_{i}\right)$ be such that

$$
\begin{equation*}
\mathbf{T}_{w}^{(i)}=\left\{\mathbf{T}_{w}^{(i)}(1)<\mathbf{T}_{w}^{(i)}(2)<\cdots<\mathrm{T}_{w}^{(i)}(i)\right\}=\{w(1), w(2), \ldots, w(i)\} \tag{64}
\end{equation*}
$$

The proof of the next lemma is standard (cf. [4, §2.4]).
Lemma 4.6. Let $i \in I$. We have

$$
\begin{aligned}
W^{I \backslash\{i\}}=\{w \in W \mid & w(1)<w(2)<\cdots<w(i), \text { and } \\
& w(i+1)<w(i+2)<\cdots<w(n)\} .
\end{aligned}
$$

The map $W^{I \backslash\{i\}} \rightarrow \operatorname{CST}_{A_{n-1}}\left(\varpi_{i}\right), w \mapsto \mathbf{T}_{w}^{(i)}$, is bijective.
We see from Lemmas 4.1-4.2 and 4.6 that the map

$$
\begin{equation*}
\mathcal{Y}_{i}^{A_{n-1}}: W_{\mathrm{af}} \rightarrow \operatorname{CST}_{A_{n-1}}\left(\varpi_{i}\right) \times \mathbb{Z}, w t_{\xi} \mapsto\left(\mathrm{T}_{w}^{(i)}, c_{i}(\xi)\right) \tag{65}
\end{equation*}
$$

induces a bijection from the subset $\left(W^{I \backslash\{i\}}\right)_{\text {af }} \subset W_{\text {af }}$ to $\operatorname{CST}_{A_{n-1}}\left(\varpi_{i}\right) \times \mathbb{Z}$.
Definition 4.7 ([10, Definition $4.2(1)])$. Define a partial order $\preceq$ on $\operatorname{CST}_{A_{n-1}}\left(\varpi_{i}\right) \times \mathbb{Z}$ as follows: for $(\mathrm{T}, c),\left(\mathrm{T}^{\prime}, c^{\prime}\right) \in \operatorname{CST}_{A_{n-1}}\left(\varpi_{i}\right) \times \mathbb{Z}$, set $(\mathrm{T}, c) \preceq\left(\mathrm{T}^{\prime}, c^{\prime}\right)$ if

$$
\begin{equation*}
\left(c \leqslant c^{\prime}\right) \text { and }\left(\mathrm{T}(u) \leqslant \mathrm{T}^{\prime}\left(u+c^{\prime}-c\right) \text { for } u \in\left[i-c^{\prime}+c\right]\right) \tag{66}
\end{equation*}
$$

Proposition 4.8. Let $i \in I$.
(1) $\mathcal{Y}_{i}^{A_{n-1}} \circ \Pi^{I \backslash\{i\}}=\mathcal{Y}_{i}^{A_{n-1}}$.
(2) For $x, y \in W_{\mathrm{af}}$, we have $\Pi^{I \backslash\{i\}}(x) \preceq \Pi^{I \backslash\{i\}}(y)$ in $\left(W^{I \backslash\{i\}}\right)_{\text {af }}$ if and only if $\mathcal{Y}_{i}^{A_{n-1}}(x) \preceq \mathcal{Y}_{i}^{A_{n-1}}(y)$ in $\operatorname{CST}_{A_{n-1}}\left(\varpi_{i}\right) \times \mathbb{Z}$.
(3) Let $(\mathrm{T}, c),\left(\mathrm{T}^{\prime}, c^{\prime}\right) \in \operatorname{CST}_{A_{n-1}}\left(\varpi_{i}\right) \times \mathbb{Z}$. If $c^{\prime}-c \geqslant \min \{i, n-i\}$, then $(\mathrm{T}, c) \preceq$ ( $\mathrm{T}^{\prime}, c^{\prime}$ ).
Proof. (1): Let $x=w t_{\xi} \in W_{\mathrm{af}}$ and $y=\Pi^{I \backslash\{i\}}(x)=v t_{\zeta}$, where $w, v \in W$ and $\xi, \zeta \in Q^{\vee}$. We see from Lemma 2.3 that $\lfloor w\rfloor^{I \backslash\{i\}}=\lfloor v\rfloor^{I \backslash\{i\}}$ and $c_{i}(\xi)=c_{i}(\zeta)$. Since $\{1,2, \ldots, i\}$ is stable under the action of $W_{I \backslash\{i\}},\lfloor w\rfloor^{I \backslash\{i\}}=\lfloor v\rfloor^{I \backslash\{i\}}$ implies $\mathrm{T}_{w}^{(i)}=\mathrm{T}_{v}^{(i)}$. Thus $\mathcal{Y}_{i}^{A_{n-1}}(x)=\mathcal{Y}_{i}^{A_{n-1}}(y)$.
(2): The assertion follows from (1) and [10, Theorem 4.7 and Equation (67)].
(3): We first assume that $c^{\prime}-c \geqslant i$. Obviously, $c \leqslant c^{\prime}$ holds. Since $i-c^{\prime}+c \leqslant 0$, the latter condition in (66) is trivial. Thus ( $\mathrm{T}, c) \preceq\left(\mathrm{T}^{\prime}, c^{\prime}\right)$.

We next assume that $i>c^{\prime}-c \geqslant n-i$. Obviously, $c \leqslant c^{\prime}$ holds. Since $\mathrm{T}(u) \in$ [ $u, u+n-i]$ holds for all $u \in[i]$, we have

$$
\begin{equation*}
\mathrm{T}(u) \leqslant u+n-i \leqslant u+c^{\prime}-c \leqslant \mathrm{~T}^{\prime}\left(u+c^{\prime}-c\right) \text { for } u \in\left[i-c+c^{\prime}\right] . \tag{67}
\end{equation*}
$$

This implies ( $\mathrm{T}, c) \preceq\left(\mathrm{T}^{\prime}, c^{\prime}\right)$.
By combining Propositions 3.2 and 4.8 (2), we obtain the following tableau criterion for the semi-infinite Bruhat order on $W_{\text {af }}$ of type $A_{n-1}^{(1)}$.
Theorem 4.9. Let $J \subset I$ and $x, y \in\left(W^{J}\right)_{\mathrm{af}}$. We have $x \preceq y$ in $\left(W^{J}\right)_{\mathrm{af}}$ if and only if $\mathcal{Y}_{i}^{A_{n-1}}(x) \preceq \mathcal{Y}_{i}^{A_{n-1}}(y)$ in $\operatorname{CST}_{A_{n-1}}\left(\varpi_{i}\right) \times \mathbb{Z}$ for all $i \in I \backslash J$.

For $w \in W$, the notation $w=i_{1} i_{2} \cdots i_{n}$ means that $w(u)=i_{u}$ for $u \in[n]$. A column-strict tableau (of skew shape) is called semi-standard if its entries are weakly increasing from right to left in each row.
Example 4.10. Assume that $n=6$. Let $w=564213, v=412635 \in W$, and

$$
\xi=\alpha_{1}^{\vee}-\alpha_{3}^{\vee}+\alpha_{4}^{\vee}+2 \alpha_{5}^{\vee}, \zeta=2 \alpha_{1}^{\vee}+3 \alpha_{2}^{\vee}+\alpha_{3}^{\vee}+2 \alpha_{4}^{\vee}+5 \alpha_{5}^{\vee} \in Q^{\vee} .
$$

Let us compare $x=w t_{\xi}$ and $y=v t_{\zeta}$ in semi-infinite Bruhat order on $W_{\text {af }}$. We have

$$
\mathrm{T}_{w}^{(1)} \mathrm{T}_{w}^{(2)} \mathrm{T}_{w}^{(3)} \mathrm{T}_{w}^{(4)} \mathrm{T}_{w}^{(5)}=\begin{array}{|l|l|l|l|l|}
\hline 5 & y^{2} & 4 & 2 & 1 \\
\hline 6 & 5 & 4 & 2 \\
\hline & 6 & 5 & 4 \\
\hline & & 6 & 5 \\
\hline
\end{array}
$$

and

$$
\mathrm{T}_{v}^{(1)} \mathrm{T}_{v}^{(2)} \mathrm{T}_{v}^{(3)} \mathrm{T}_{v}^{(4)} \mathrm{T}_{v}^{(5)}=\begin{array}{|l|l|l|l|l|}
\hline 4 & 1 & 1 & 1 & 1 \\
\hline 4 & 2 & 2 & 2 \\
\hline & 4 & 4 & 3 \\
\hline & & 6 & 4 \\
\hline
\end{array} .
$$

(1) $\mathcal{Y}_{1}^{A_{n-1}}(x) \preceq \mathcal{Y}_{1}^{A_{n-1}}(y)$ since $c_{1}(\zeta)-c_{1}(\xi)=1=\min \{1,6-1\}$ (see Proposition 4.8 (3)).
(2) $\mathcal{Y}_{2}^{A_{n-1}}(x) \preceq \mathcal{Y}_{2}^{A_{n-1}}(y)$ since $c_{2}(\zeta)-c_{2}(\xi)=3 \geqslant 2=\min \{2,6-2\}$ (see Proposition 4.8 (3)).

(3) $\mathcal{Y}_{3}^{A_{n-1}}(x) \preceq \mathcal{Y}_{3}^{A_{n-1}}(y)$ since $c_{3}(\zeta)-c_{3}(\xi)=2$ and \begin{tabular}{|l|l}
\hline 1 \& <br>
\hline 2 \& <br>
\hline 4 \& 4 <br>
\hline 5 <br>
\hline 6 <br>
\hline

 is semi-standard (see (66)), where $\mathrm{T}_{w}^{(3)}=$

\hline$\frac{4}{5}$ <br>
\hline 6 <br>
\hline

 and $\mathrm{T}_{v}^{(3)}=$

\hline 1 <br>
\hline 2 <br>
\hline 4 <br>
\hline
\end{tabular}

(4) $\mathcal{Y}_{4}^{A_{n-1}}(x) \preceq \mathcal{Y}_{4}^{A_{n-1}}(y)$ since $c_{4}(\zeta)-c_{4}(\xi)=1$ and \begin{tabular}{|l|l|}
\hline 1 \& <br>
\hline 2 \& 2 <br>
\hline 4 \& 4 <br>
\hline 6 \& 5 <br>
\hline \& 6 <br>
\hline

 is semi-standard (see (66)), where $\mathrm{T}_{w}^{(4)}=$

\hline$\frac{2}{4}$ <br>
\hline 5 <br>
\hline 6 <br>
\hline

 and $\mathrm{T}_{v}^{(4)}=$

\hline 1 <br>
\hline 2 <br>
\hline 4 <br>
\hline 6 <br>
\hline
\end{tabular} .

(5) $\mathcal{Y}_{5}^{A_{n-1}}(x) \preceq \mathcal{Y}_{5}^{A_{n-1}}(y)$ since $c_{5}(\zeta)-c_{5}(\xi)=3 \geqslant 1=\min \{5,6-5\}$ (see Proposition 4.8 (3)).
By Theorem 4.9, we conclude that $x \preceq y$.
4.4. Type $C_{n}^{(1)}$. Fix an integer $n \geqslant 2$. Set $I=[n]$. We assume that the labeling of the vertices of the Dynkin diagram of type $C_{n}$ is as follows.

Let $\varepsilon_{1}, \varepsilon_{2}, \ldots, \varepsilon_{n}$ be an orthonormal basis of an $n$-dimensional Euclidean space $\mathbb{R}^{n}$. Let $\Delta=\left\{ \pm\left(\varepsilon_{s} \pm \varepsilon_{t}\right) \mid s, t \in[n], s<t\right\} \sqcup\left\{ \pm 2 \varepsilon_{s} \mid s \in[n]\right\}$ be a root system of type $C_{n}$, and let $\Pi=\left\{\alpha_{s}=\varepsilon_{s}-\varepsilon_{s+1} \mid s \in[n-1]\right\} \sqcup\left\{\alpha_{n}=2 \varepsilon_{n}\right\}$ be a simple root system of $\Delta$.

Let $W$ be the Weyl group of $\Delta$. Note that $W$ acts faithfully on $\left\{ \pm \varepsilon_{s} \mid s \in[n]\right\} \subset \mathbb{R}^{n}$. Define a totally ordered set $\mathcal{C}_{n}$ by

$$
\begin{equation*}
\mathcal{C}_{n}=\{1 \prec 2 \prec \cdots \prec n-1 \prec n \prec \bar{n} \prec \overline{n-1} \prec \cdots \prec \overline{2} \prec \overline{1}\} . \tag{68}
\end{equation*}
$$

Let $\sigma: \mathcal{C}_{n} \rightarrow \mathcal{C}_{n}$ be the bijection defined by $s \leftrightarrow \bar{s}$ for $s \in[n]$. If we identify $\mathcal{C}_{n}$ with $\left\{ \pm \varepsilon_{s} \mid s \in[n]\right\}$ by $s=\varepsilon_{s}$ and $\bar{s}=-\varepsilon_{s}$ for $s \in[n]$, then $W$ can be described as follows:

$$
\begin{equation*}
W=\left\{w \in \mathfrak{S}\left(\mathcal{C}_{n}\right) \mid w(\sigma(s))=\sigma(w(s)) \text { for } s \in[n]\right\} \tag{69}
\end{equation*}
$$

Let $\left(s_{1} s_{2} \cdots s_{l}\right) \in \mathfrak{S}\left(\mathcal{C}_{n}\right)$ denote the cyclic permutation $s_{1} \mapsto s_{2} \mapsto \cdots \mapsto s_{l} \mapsto s_{1}$, where $l \geqslant 1$ and $s_{1}, s_{2}, \ldots, s_{l} \in \mathcal{C}_{n}$ are all distinct. For $s, t \in[n], s<t$, we have $r_{ \pm\left(\varepsilon_{s}-\varepsilon_{t}\right)}=(s t)(\bar{s} \bar{t}), r_{ \pm 2 \varepsilon_{s}}=(s \bar{s})$, and $r_{ \pm\left(\varepsilon_{s}+\varepsilon_{t}\right)}=(s \bar{t})(\bar{s} t)$ in $\mathfrak{S}\left(\mathcal{C}_{n}\right)$.

For $w \in \mathfrak{S}\left(\mathcal{C}_{n}\right)$ and $s \in[n]$, set

$$
\begin{align*}
& \mathrm{A}_{s}(w)=\left\{t \in[s+1, n] \mid w(s) \succ w(t) \text { in } \mathcal{C}_{n}\right\}, \quad \mathrm{a}_{s}(w)=\# \mathrm{~A}_{s}(w)  \tag{70}\\
& \mathrm{B}_{s}(w)=\left\{t \in[s+1, n] \mid w(s) \succ \sigma(w(t)) \text { in } \mathcal{C}_{n}\right\}, \quad \mathrm{b}_{s}(w)=\# \mathrm{~B}_{s}(w),  \tag{71}\\
& \mathrm{e}_{s}(w)= \begin{cases}0 & \text { if } w(s) \preceq n, \\
1 & \text { if } w(s) \succeq \bar{n} ;\end{cases} \tag{72}
\end{align*}
$$

note that $\mathrm{a}_{n}(w)=\mathrm{b}_{n}(w)=0$ for $w \in \mathfrak{S}\left(\mathcal{C}_{n}\right)$. The length function $\ell: W \rightarrow \mathbb{Z}_{\geqslant 0}$ is given by

$$
\begin{equation*}
\ell(w)=\sum_{s=1}^{n}\left(\mathrm{a}_{s}(w)+\mathrm{b}_{s}(w)+\mathrm{e}_{s}(w)\right) \tag{73}
\end{equation*}
$$

for $w \in W$. The longest element of $W$ is given by $u \mapsto \bar{u}, u \in[n]$.
Let $\|\cdot\|: \mathcal{C}_{n} \rightarrow[n]$ be the map defined by $\|s\|=s$ and $\|\bar{s}\|=s$ for $s \in[n]$. We identify an $i$-element subset $\mathrm{T}=\{\mathrm{T}(1) \prec \mathrm{T}(2) \prec \cdots \prec \mathrm{T}(i)\} \subset \mathcal{C}_{n}$ with the column-strict tableau of the form (63). Set

$$
\begin{equation*}
\operatorname{CST}_{C_{n}}\left(\varpi_{i}\right)=\left\{\mathrm{T} \mid \mathrm{T} \subset \mathcal{C}_{n}, \# \mathrm{~T}=i, \text { and }\|\mathrm{T}(u)\|, u \in[i], \text { are all distinct }\right\} \tag{74}
\end{equation*}
$$

For $w \in W$, let $\mathrm{T}_{w}^{(i)} \in \operatorname{CST}_{C_{n}}\left(\varpi_{i}\right)$ be such that

$$
\begin{equation*}
\mathrm{T}_{w}^{(i)}=\left\{\mathrm{T}_{w}^{(i)}(1) \prec \mathrm{T}_{w}^{(i)}(2) \prec \cdots \prec \mathrm{T}_{w}^{(i)}(i)\right\}=\{w(1), w(2), \ldots, w(i)\} \tag{75}
\end{equation*}
$$

The proof of the next lemma is standard (cf. [4, §8.1]).
Lemma 4.11. Let $i \in I$. We have

$$
\begin{aligned}
W^{I \backslash\{i\}}=\{w \in W \mid & w(1) \prec w(2) \prec \cdots \prec w(i), \text { and } \\
& w(i+1) \prec w(i+2) \prec \cdots \prec w(n) \preceq n\} .
\end{aligned}
$$

If $w \in W^{I \backslash\{i\}}$, then $\ell(w)=\sum_{s=1}^{i}\left(\mathrm{a}_{s}(w)+\mathrm{b}_{s}(w)+\mathrm{e}_{s}(w)\right)$ and $\mathrm{A}_{s}(w) \subset[i+1, n]$ for $s \in[i]$. The map $W^{I \backslash\{i\}} \rightarrow \operatorname{CST}_{C_{n}}\left(\varpi_{i}\right), w \mapsto \mathrm{~T}_{w}^{(i)}$, is bijective.

We see from Lemmas 4.1-4.2 and 4.11 that the map

$$
\begin{equation*}
\mathcal{Y}_{i}^{C_{n}}: W_{\mathrm{af}} \rightarrow \operatorname{CST}_{C_{n}}\left(\varpi_{i}\right) \times \mathbb{Z}, w t_{\xi} \mapsto\left(\mathrm{T}_{w}^{(i)}, c_{i}(\xi)\right) \tag{76}
\end{equation*}
$$

induces a bijection from the subset $\left(W^{I \backslash\{i\}}\right)_{\text {af }} \subset W_{\text {af }}$ to $\operatorname{CST}_{C_{n}}\left(\varpi_{i}\right) \times \mathbb{Z}$.
Definition 4.12. Define a partial order $\preceq$ on $\operatorname{CST}_{C_{n}}\left(\varpi_{i}\right) \times \mathbb{Z}$ as follows: for $(\mathrm{T}, c),\left(\mathrm{T}^{\prime}, c^{\prime}\right) \in \mathrm{CST}_{C_{n}}\left(\varpi_{i}\right) \times \mathbb{Z}$, set $(\mathrm{T}, c) \preceq\left(\mathrm{T}^{\prime}, c^{\prime}\right)$ if

$$
\begin{equation*}
\left(c \leqslant c^{\prime}\right) \text { and }\left(\mathrm{T}(u) \preceq \mathrm{T}^{\prime}\left(u+c^{\prime}-c\right) \text { in } \mathcal{C}_{n} \text { for } u \in\left[i-c^{\prime}+c\right]\right) . \tag{77}
\end{equation*}
$$

Proposition 4.13. Let $i \in I$.
(1) $\mathcal{Y}_{i}^{C_{n}} \circ \Pi^{I \backslash\{i\}}=\mathcal{Y}_{i}^{C_{n}}$.
(2) For $x, y \in W_{\text {af }}$, we have $\Pi^{I \backslash\{i\}}(x) \preceq \Pi^{I \backslash\{i\}}(y)$ in $\left(W^{I \backslash\{i\}}\right)_{\text {af }}$ if and only if $\mathcal{Y}_{i}^{C_{n}}(x) \preceq \mathcal{Y}_{i}^{C_{n}}(y)$ in $\operatorname{CST}_{C_{n}}\left(\varpi_{i}\right) \times \mathbb{Z}$.
(3) Let $(\mathrm{T}, c),\left(\mathrm{T}^{\prime}, c^{\prime}\right) \in \operatorname{CST}_{C_{n}}\left(\varpi_{i}\right) \times \mathbb{Z}$. If $c^{\prime}-c \geqslant i$, then $(\mathrm{T}, c) \preceq\left(\mathrm{T}^{\prime}, c^{\prime}\right)$.

By combining Propositions 3.2 and $4.13(2)$, we obtain the following tableau criterion for the semi-infinite Bruhat order on $W_{\text {af }}$ of type $C_{n}^{(1)}$.
Theorem 4.14. Let $J \subset I$. For $x, y \in\left(W^{J}\right)_{\text {af }}$, we have $x \preceq y$ in $\left(W^{J}\right)_{\text {af }}$ if and only if $\mathcal{Y}_{i}^{C_{n}}(x) \preceq \mathcal{Y}_{i}^{C_{n}}(y)$ in $\operatorname{CST}_{C_{n}}\left(\varpi_{i}\right) \times \mathbb{Z}$ for all $i \in I \backslash J$.

The remainder of this subsection is devoted to the proof of Proposition 4.13.
The proofs of Lemmas 4.15-4.16 below are straightforward.
Lemma 4.15. Let $i \in I$ and $\gamma \in \Delta^{+} \backslash \Delta_{I \backslash\{i\}}^{+}$. We have $\gamma^{\vee} \in Q^{\vee, I \backslash\{i\}}$ if and only if one of the following conditions holds:
(1) $\gamma^{\vee}=\varepsilon_{i}=\alpha_{i}^{\vee}+\alpha_{i+1}^{\vee}+\cdots+\alpha_{n}^{\vee}$.
(2) $\gamma^{\vee}=\varepsilon_{i-1}+\varepsilon_{i}=\alpha_{i-1}^{\vee}+2 \alpha_{i}^{\vee}+\cdots+2 \alpha_{n}^{\vee}$.

Lemma 4.16. Let $i \in I$. We have $2\left\langle\alpha_{i}^{\vee}, \rho-\rho_{I \backslash\{i\}}\right\rangle=2 n-i+1$.
Proposition 4.17 (cf. [4, §8.1]). Let $i \in I, w \in W^{I \backslash\{i\}}$, and $\gamma \in \Delta^{+}$. There exists a Bruhat edge $w \xrightarrow{\gamma}\left\lfloor w r_{\gamma}\right\rfloor=w r_{\gamma}$ in $\mathrm{QB}^{I \backslash\{i\}}$ if and only if $\gamma \in \Delta^{+} \backslash \Delta_{I \backslash\{i\}}^{+}$and one of the following statements holds.
(b-C1) $i \in[n-1], c_{i}\left(\gamma^{\vee}\right)=1$, and there exists $s \in[i]$ such that $w r_{\gamma}(u)=w(u)$ for $u \in[i] \backslash\{s\}, 1 \preceq w(s) \prec n$, and $w r_{\gamma}(s)=\min ([w(s)+1, n] \backslash\{\|w(u)\| \mid u \in$ $[i], w(u) \succeq \bar{n}\})$; in this case, we have $\gamma^{\vee}=\varepsilon_{s}-\varepsilon_{t}=\alpha_{s}^{\vee}+\alpha_{s+1}^{\vee}+\cdots+\alpha_{t}^{\vee}$ for some $t \in[i+1, n]$.
(b-C2) $i \in[n-1], c_{i}\left(\gamma^{\vee}\right)=1$, and there exists $s \in[i]$ such that $w r_{\gamma}(u)=w(u)$ for $u \in[i] \backslash\{s\}, \bar{n} \preceq w(s) \prec \overline{1}$, and $w r_{\gamma}(s)=\sigma(\max ([\|w(s)\|-1] \backslash\{w(u) \mid u \in$ $[i], w(u) \preceq n\}))$; in this case, we have $\gamma^{\vee}=\varepsilon_{s}-\varepsilon_{t}=\alpha_{s}^{\vee}+\alpha_{s+1}^{\vee}+\cdots+\alpha_{t}^{\vee}$ for some $t \in[i+1, n]$.
(b-C3) $i \in[2, n], c_{i}\left(\gamma^{\vee}\right)=2$, and there exist $s, t \in[i]$ such that $s<t, w r_{\gamma}(u)=w(u)$ for $u \in[i] \backslash\{s, t\}$, and $w r_{\gamma}(s)=w(s)+1=\sigma(w(t))=\sigma\left(w r_{\gamma}(t)\right)+1 \preceq n$; in this case, we have $\gamma^{\vee}=\varepsilon_{s}+\varepsilon_{t}=\alpha_{s}^{\vee}+\cdots+\alpha_{t-1}^{\vee}+2 \alpha_{t}^{\vee}+\cdots+2 \alpha_{n}^{\vee}$.
(b-C4) $c_{i}\left(\gamma^{\vee}\right)=1$, and there exists $s \in[i]$ such that $w r_{\gamma}(u)=w(u)$ for $u \in[i] \backslash\{s\}$ and $\sigma\left(w_{\gamma}(s)\right)=w(s)=n$; in this case, we have $\gamma^{\vee}=\varepsilon_{s}=\alpha_{s}^{\vee}+\alpha_{s+1}^{\vee}+\cdots+$ $\alpha_{n}^{\vee}$.
Moreover, for $w, v \in W^{I \backslash\{i\}}$, we have $w \preceq v$ if and only if $w(u) \preceq v(u)$ in $\mathcal{C}_{n}$ for $u \in[i]$.

Proposition 4.18. Let $i \in I, w \in W^{I \backslash\{i\}}$ and $\gamma \in \Delta^{+}$. There exists a quantum edge $w \xrightarrow{\gamma}\left\lfloor w r_{\gamma}\right\rfloor$ in $\mathrm{QB}^{I \backslash\{i\}}$ if and only if $\gamma \in \Delta^{+} \backslash \Delta_{I \backslash\{i\}}^{+}$and the following statement holds:
$(\mathrm{q}-\mathrm{C}) c_{i}\left(\gamma^{\vee}\right)=1,\left\lfloor w r_{\gamma}\right\rfloor(1)=1,\left\lfloor w r_{\gamma}\right\rfloor(u)=w(u-1)$ for $u \in[2, i]$, and $w(i)=\overline{1}$; in this case, we have $\gamma^{\vee}=\varepsilon_{i}=\alpha_{i}^{\vee}+\alpha_{i+1}^{\vee}+\cdots+\alpha_{n}^{\vee}$.
Before starting the proof of Proposition 4.18, we mention a consequence of Lemma 4.3 and Propositions 4.17-4.18.

Proposition 4.19. Let $i \in I, x, y \in\left(W^{I \backslash\{i\}}\right)_{\mathrm{af}}, \mathcal{Y}_{i}^{C_{n}}(x)=(\mathrm{T}, c)$, and $\mathcal{Y}_{i}^{C_{n}}(y)=$ $\left(\mathrm{T}^{\prime}, c^{\prime}\right)$. There exists an edge $x \xrightarrow{\beta} y$ in $\mathrm{SiB}^{I \backslash\{i\}}$ for some $\beta \in \Delta_{\mathrm{af}}^{+}$if and only if one of the following conditions holds:
$\left(\frac{\infty}{2}-\mathrm{C} 1\right) i \in[n-1], c^{\prime}=c$, and there exists $s \in[i]$ such that $\mathrm{T}^{\prime}(u)=\mathrm{T}(u)$ for $u \in[i] \backslash\{s\}, 1 \preceq \mathrm{~T}(s) \prec n$, and $\mathrm{T}^{\prime}(s)=\min ([\mathrm{T}(s)+1, n] \backslash\{\|\mathrm{T}(u)\| \mid u \in$ $[i], \mathrm{T}(u) \succeq \bar{n}\})$.
$\left(\frac{\infty}{2}-\mathrm{C} 2\right) i \in[n-1], c^{\prime}=c$, and there exists $s \in[i]$ such that $\mathrm{T}^{\prime}(u)=\mathrm{T}(u)$ for $u \in[i] \backslash\{s\}, \bar{n} \preceq \mathrm{~T}(s) \prec \overline{1}$, and $\mathrm{T}^{\prime}(s)=\sigma(\max ([\|\mathrm{T}(s)\|-1] \backslash\{\mathrm{T}(u) \mid u \in$ $[i], \mathrm{T}(u) \preceq n\}))$.
$\left(\frac{\infty}{2}\right.$-C3) $i \in[2, n], c^{\prime}=c$, and there exist $s, t \in[i]$ such that $s<t, \mathrm{~T}^{\prime}(u)=\mathbf{T}(u)$ for $u \in[i] \backslash\{s, t\}$, and $\mathrm{T}^{\prime}(s)=\mathrm{T}(s)+1=\sigma(\mathrm{T}(t))=\sigma\left(\mathrm{T}^{\prime}(t)\right)+1 \preceq n$.
$\left(\frac{\infty}{2}-\mathrm{C} 4\right) c^{\prime}=c$, and there exists $s \in[i]$ such that $\mathrm{T}^{\prime}(u)=\mathrm{T}(u)$ for $u \in[i] \backslash\{s\}$ and $\sigma\left(\mathrm{T}^{\prime}(s)\right)=\mathrm{T}(s)=n$.
$\left(\frac{\infty}{2}-\mathrm{C} 5\right) c^{\prime}=c+1, \mathrm{~T}^{\prime}(1)=1, \mathrm{~T}^{\prime}(u)=\mathrm{T}(u-1)$ for $u \in[2, i]$, and $\mathrm{T}(i)=\overline{1}$.
For $i \in I, w \in W^{I \backslash\{i\}}$ and $\gamma \in \Delta^{+} \backslash \Delta_{I \backslash\{i\}}^{+}$, let $\mathrm{Q}(i, w, \gamma)$ denote the following statement.
$\mathrm{Q}(i, w, \gamma)$ : There exists a quantum edge $w \xrightarrow{\gamma}\left\lfloor w r_{\gamma}\right\rfloor$ in $\mathrm{QB}^{I \backslash\{i\}}$.
Proof of Proposition 4.18. By Lemmas 4.4 and 4.15, we may assume that $\gamma^{\vee} \in$ $Q^{\vee, I \backslash\{i\}},\left\lfloor w r_{\gamma}\right\rfloor=w r_{\gamma}\left(z_{\gamma^{\vee}}^{I \backslash\{i\}}\right)^{-1}$ and $c_{i}\left(\gamma^{\vee}\right) \in\{1,2\}$. Let $I \backslash\{i\}=I_{1} \sqcup I_{2}$, where $I_{1}=[i-1]$ is of type $A_{i-1}$ and $I_{2}=[i+1, n]$ is of type $C_{n-i}$. The proof will be divided into three steps.

Step 1. We show that $c_{i}\left(\gamma^{\vee}\right)=1$ and $\mathrm{Q}(i, w, \gamma)$ imply ( $\mathrm{q}-\mathrm{C}$ ). It follows from Lemmas 4.5 and 4.16 that $c_{i}\left(\gamma^{\vee}\right)=1$ and $\mathrm{Q}(i, w, \gamma)$ are equivalent to $\ell\left(\left\lfloor w r_{\gamma}\right\rfloor\right)-\ell(w)=i-2 n$. By Lemma 4.15, $\gamma^{\vee}=\varepsilon_{i}$ and $r_{\gamma}=(i \bar{i})$. We see that $(i-1,0) \in\left(I_{1}\right)_{\mathrm{af}} \times\left(I_{2}\right)_{\mathrm{af}}$ satisfies the condition for $\gamma^{\vee} \in Q^{\vee}$ in Lemma 4.1; note that $I_{1} \backslash\{i-1\}=[i-2]$ is of type $A_{i-2}$. Hence $z_{\gamma^{\vee}}^{I \backslash\{i\}}=w_{0}^{I_{1}} w_{0}^{I_{1} \backslash\{i-1\}}=\left(\begin{array}{llll}1 & 2 & \cdots & i)(\overline{1} \overline{2} \cdots \\ \bar{i}\end{array}\right)$ and $\left\lfloor w r_{\gamma}\right\rfloor=$ $w(i \bar{i})(i \cdots 21)(\bar{i} \cdots \overline{2} \overline{1})$. We have $\left\lfloor w r_{\gamma}\right\rfloor(1)=w(\bar{i}),\left\lfloor w r_{\gamma}\right\rfloor(u)=w(u-1)$ for $u \in[2, i]$, and $\left\lfloor w r_{\gamma}\right\rfloor(u)=w(u)$ for $u \in[i+1, n]$. It follows from Lemma 4.11 that

$$
\begin{equation*}
\underbrace{w(\bar{i})}_{\preceq n} \prec w(1) \prec w(2) \prec \cdots \prec w(i-1) \prec \underbrace{w(i)}_{\succeq \bar{n}} . \tag{78}
\end{equation*}
$$

It remains to prove that $w(i)=\overline{1}$. If we prove that
(1) $\mathrm{e}_{1}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=0$,
(2) $\mathrm{a}_{1}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)+\mathrm{b}_{1}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=w(\bar{i})-1$,
(3) $\mathrm{a}_{i}(w)=n-i, \mathrm{~b}_{i}(w)=n-i-(w(\bar{i})-1), \mathrm{e}_{i}(w)=1$,
(4) $\mathrm{e}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=\mathrm{e}_{s-1}(w)$ for $s \in[2, i]$,
(5) $\mathrm{a}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=\mathrm{a}_{s-1}(w)$ and $\mathrm{b}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=\mathrm{b}_{s-1}(w)-1$ for $s \in[2, i]$,
then the assertion follows. Indeed, by Lemma 4.11, we have

$$
\begin{aligned}
\ell\left(\left\lfloor w r_{\gamma}\right\rfloor\right)-\ell(w)= & \underbrace{\mathrm{a}_{1}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)+\mathrm{b}_{1}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)}_{=w(\bar{i})-1}+\underbrace{\mathrm{e}_{1}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)}_{=0} \\
& -\underbrace{\left(\mathrm{a}_{i}(w)+\mathrm{b}_{i}(w)+\mathrm{e}_{i}(w)\right)}_{=1+2(n-i)-(w(\bar{i})-1)} \\
& +\sum_{s=2}^{i}(\underbrace{\left(\mathrm{a}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)-\mathrm{a}_{s-1}(w)\right.}_{=0}) \\
& +\sum_{s=2}^{i}(\underbrace{\mathrm{~b}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)-\mathrm{b}_{s-1}(w)}_{=-1}) \\
& +\sum_{s=2}^{i}(\underbrace{\left(\mathrm{e}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)-\mathrm{e}_{s-1}(w)\right.}_{=0}) \\
= & i-2 n+2(w(\bar{i})-1) .
\end{aligned}
$$

Since $\ell\left(\left\lfloor w r_{\gamma}\right\rfloor\right)-\ell(w)=i-2 n$, we get $w(\bar{i})=1$ and $w(i)=\overline{1}$.
We prove (1)-(5) as follows.
(1) follows from $\left\lfloor w r_{\gamma}\right\rfloor(1)=w(\bar{i})$ and (78).
(2): We see from $\left\lfloor w r_{\gamma}\right\rfloor(1)=w(\bar{i}),\left\lfloor w r_{\gamma}\right\rfloor(u)=w(u-1)$ for $u \in[2, i],\left\lfloor w r_{\gamma}\right\rfloor(u)=$ $w(u)$ for $u \in[i+1, n]$, and (78) (see also Lemma 4.11) that $\mathrm{A}_{1}\left(\left\lfloor w r_{\gamma}\right\rfloor\right), \mathrm{B}_{1}\left(\left\lfloor w r_{\gamma}\right\rfloor\right) \subset$ $[i+1, n]$ and

$$
\begin{aligned}
& \mathrm{A}_{1}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=\{t \in[i+1, n] \mid w(\bar{i}) \succ w(t)\} \\
& \mathrm{B}_{1}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=\{t \in[i+1, n] \mid w(i) \prec w(t)\} .
\end{aligned}
$$

Hence $\mathrm{A}_{1}\left(\left\lfloor w r_{\gamma}\right\rfloor\right) \cap \mathrm{B}_{1}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=\varnothing$ and

$$
\mathrm{A}_{1}\left(\left\lfloor w r_{\gamma}\right\rfloor\right) \sqcup \mathrm{B}_{1}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=\{t \in[n] \mid\|w(t)\|<w(\bar{i})\}
$$

which implies $\mathrm{a}_{1}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)+\mathrm{b}_{1}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=w(\bar{i})-1$.
(3): Since $\bar{n} \preceq w(i)$, we have $\mathrm{e}_{i}(w)=1, \mathrm{~A}_{i}(w)=[i+1, n]$, and hence $\mathrm{a}_{i}(w)=n-i$.

We see from $w(\bar{i}) \prec w(1)$ that $\mathrm{B}_{i}(w)=[i+w(\bar{i}), n]$ and $\mathrm{b}_{i}(w)=n-i-(w(\bar{i})-1)$.
(4) follows from $\left\lfloor w r_{\gamma}\right\rfloor(s)=w(s-1)$ for $s \in[2, i]$.
(5): Let $s \in[2, i]$. We see from Lemma 4.11 that

$$
\mathrm{A}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=\{t \in[i+1, n] \mid \underbrace{\left\lfloor w r_{\gamma}\right\rfloor(s)}_{=w(s-1)} \succ \underbrace{\left\lfloor w r_{\gamma}\right\rfloor(t)}_{=w(t)}\}=\mathrm{A}_{s-1}(w) \text {, }
$$

which implies $\mathrm{a}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=\mathrm{a}_{s-1}(w)$ for $s \in[2, i]$. Similarly, we deduce from $i \in$ $\mathrm{B}_{s-1}(w)$ that the map

$$
\mathrm{B}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right) \rightarrow \mathrm{B}_{s-1}(w) \backslash\{i\}, t \mapsto \begin{cases}t-1 & \text { if } t \in[s+1, i] \\ t & \text { if } t \in[i+1, n]\end{cases}
$$

is bijective, which implies $\mathbf{b}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=\mathrm{b}_{s-1}(w)-1$ for $s \in[2, i]$.

Step 2. We show that $c_{i}\left(\gamma^{\vee}\right)=2$ and $\mathrm{Q}(i, w, \gamma)$ lead to a contradiction; the computation below will be used again in the proofs of Lemmas 4.32-4.33 in §4.5. It follows from Lemmas 4.5 and 4.16 that $c_{i}\left(\gamma^{\vee}\right)=2$ and $\mathrm{Q}(i, w, \gamma)$ are equivalent to $\ell\left(\left\lfloor w r_{\gamma}\right\rfloor\right)-\ell(w)=2 i-4 n-1$. By Lemma 4.15, $\gamma^{\vee}=\varepsilon_{i-1}+\varepsilon_{i}$ and $r_{\gamma}=(i-1 \bar{i})(\overline{i-1} i)$. We see that $(i-2,0) \in\left(I_{1}\right)_{\text {af }} \times\left(I_{2}\right)_{\text {af }}$ satisfies the condition for $\gamma^{\vee} \in Q^{\vee}$ in Lemma 4.1; note that $I_{1} \backslash\{i-2\}=[i-3] \sqcup\{i-1\}$ is of type $A_{i-3} \times A_{1}$. Hence $z_{\gamma \vee}^{I \backslash\{i\}}=w_{0}^{I_{1}} w_{0}^{I_{1} \backslash\{i-2\}}$ is given by $u \mapsto u+2$ for $u \in[i-2], i-1 \mapsto 1$, and $i \mapsto 2$. We have $\left\lfloor w r_{\gamma}\right\rfloor(1)=w(\bar{i})$, $\left\lfloor w r_{\gamma}\right\rfloor(2)=w(\overline{i-1}),\left\lfloor w r_{\gamma}\right\rfloor(u)=w(u-2)$ for $u \in[3, i\rfloor$, and $\left\lfloor w r_{\gamma}\right\rfloor(u)=w(u)$ for $u \in[i+1, n]$. It follows from Lemma 4.11 that

$$
\begin{equation*}
\underbrace{w(\bar{i}) \prec w(\overline{i-1})}_{\preceq n} \prec w(1) \prec w(2) \prec \cdots \prec w(i-2) \prec \underbrace{w(i-1) \prec w(i)}_{\succeq \bar{n}} ; \tag{79}
\end{equation*}
$$

note that $w(\bar{i})-1 \geqslant 0$ and $w(\overline{i-1})-2 \geqslant 0$. If we prove that
(1) $\mathrm{e}_{1}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=\mathrm{e}_{2}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=0, \mathrm{e}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=\mathrm{e}_{s-2}(w)$ for $s \in[3, i], \mathrm{e}_{i-1}(w)=$ $\mathrm{e}_{i}(w)=1$,
(2) $\mathrm{a}_{1}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=w(\bar{i})-1, \mathrm{a}_{2}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=w(\overline{i-1})-2, \mathrm{a}_{i-1}(w)=\mathrm{a}_{i}(w)=n-i$,
(3) $\mathrm{b}_{1}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=\mathrm{b}_{2}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=0, \mathrm{~b}_{i-1}(w)=n-i-(w(\overline{i-1})-2)+1, \mathrm{~b}_{i}(w)=$ $n-i-(w(\bar{i})-1)$,
(4) $\mathrm{a}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=\mathrm{a}_{s-2}(w)$ and $\mathrm{b}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=\mathrm{b}_{s-2}(w)-2$ for $s \in[3, i]$,
then the assertion follows. Indeed, (1)-(4) and Lemma 4.11 imply

$$
\begin{aligned}
\ell\left(\left\lfloor w r_{\gamma}\right\rfloor\right)-\ell(w) & =2 i-4 n+1+2 \underbrace{(w(\bar{i})-1)}_{\geqslant 0}+2 \underbrace{(w(\overline{i-1})-2)}_{\geqslant 0} \\
& >2 i-4 n-1,
\end{aligned}
$$

contrary to $\ell\left(\left\lfloor w r_{\gamma}\right\rfloor\right)-\ell(w)=2 i-4 n-1$.
We prove (1)-(4) as follows.
(1) follows from (79).
(2): We see from Lemma 4.11 and (79) that

$$
\mathrm{A}_{1}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=\{t \in[i+1, n] \mid \underbrace{\left\lfloor w r_{\gamma}\right\rfloor(1)}_{=w(\bar{i})} \succ \underbrace{\left\lfloor w r_{\gamma}\right\rfloor(t)}_{=w(t)}\}=[i+1, i+w(\bar{i})-1] \text {, }
$$

which implies $\mathrm{a}_{1}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=w(\bar{i})-1$. Similarly, we have

$$
\begin{aligned}
\mathrm{A}_{2}\left(\left\lfloor w r_{\gamma}\right\rfloor\right) & =[i+1, i+w(\overline{i-1})-2], \\
\mathrm{A}_{i-1}(w) & =\mathrm{A}_{i}(w)=[i+1, n]
\end{aligned}
$$

which imply $\mathrm{a}_{2}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=w(\overline{i-1})-2$ and $\mathrm{a}_{i-1}(w)=\mathrm{a}_{i}(w)=n-i$.
(3): We claim that $\mathrm{B}_{1}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=\varnothing$. Suppose that $2 \in \mathrm{~B}_{1}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)$. Then $w(\bar{i})=$ $\left\lfloor w r_{\gamma}\right\rfloor(1) \succ \sigma\left(\left\lfloor w r_{\gamma}\right\rfloor(2)\right)=w(i-1)$, contrary to (79). Suppose that $t \in \mathrm{~B}_{1}\left(\left\lfloor w r_{\gamma}\right\rfloor\right) \cap$ $[3, i]$. Then $w(\bar{i})=\left\lfloor w r_{\gamma}\right\rfloor(1) \succ \sigma\left(\left\lfloor w r_{\gamma}\right\rfloor(t)\right)=\sigma(w(t-2))$ and hence $w(i) \prec w(t-2)$, contrary to (79). Suppose that $t \in \mathrm{~B}_{1}\left(\left\lfloor w r_{\gamma}\right\rfloor\right) \cap[i+1, n]$. Then $w(\bar{i})=\left\lfloor w r_{\gamma}\right\rfloor(1) \succ$ $\sigma\left(\left\lfloor w r_{\gamma}\right\rfloor(t)\right)=\sigma(w(t))$ and hence $\bar{n} \preceq w(i) \prec w(t)$, contrary to Lemma 4.11. Consequently, we have $\mathrm{B}_{1}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=\varnothing$ and $\mathrm{b}_{1}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=0$ as claimed. Similarly, we have $\mathrm{B}_{2}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=\varnothing$ and $\mathrm{b}_{2}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=0$. We next claim that $\mathrm{B}_{i}(w)=[i+1, n] \backslash \mathrm{A}_{1}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)$. Indeed,

$$
\begin{aligned}
\mathrm{B}_{i}(w) & =\{t \in[i+1, n] \mid w(i) \succ \sigma(w(t))\} \\
& =\{t \in[i+1, n] \mid w(\bar{i}) \prec w(t)\} \\
& =[i+1, n] \backslash \mathrm{A}_{1}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)
\end{aligned}
$$

This implies $\mathrm{b}_{i}(w)=n-i-(w(\bar{i})-1)$. Similarly, we have $\mathrm{B}_{i-1}(w)=[i, n] \backslash \mathrm{A}_{2}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)$ and $\mathrm{b}_{i-1}(w)=n-i-(w(\overline{i-1})-2)+1$.
(4): Let $s \in[3, i]$. We see from Lemma 4.11 that

$$
\mathrm{A}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=\{t \in[i+1, n] \mid \underbrace{\left\lfloor w r_{\gamma}\right\rfloor(s)}_{=w(s-2)} \succ \underbrace{\left\lfloor w r_{\gamma}\right\rfloor(t)}_{=w(t)}\}=\mathrm{A}_{s-2}(w),
$$

which implies $\mathrm{a}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=\mathrm{a}_{s-2}(w)$ for $s \in[3, i]$. Similarly, we deduce from $i-1, i \in$ $\mathrm{B}_{s-2}(w)$ that the map

$$
\mathrm{B}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right) \rightarrow \mathrm{B}_{s-2}(w) \backslash\{i-1, i\}, t \mapsto \begin{cases}t-2 & \text { if } t \in[s+1, i], \\ t & \text { if } t \in[i+1, n],\end{cases}
$$

is bijective, which implies $\mathrm{b}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=\mathrm{b}_{s-2}(w)-2$ for $s \in[3, i]$.
Step 3. We show that ( $\mathrm{q}-\mathrm{C}$ ) implies $\mathrm{Q}(i, w, \gamma)$. Assume that ( $\mathrm{q}-\mathrm{C}$ ) is true. Since $c_{i}\left(\gamma^{\vee}\right)=1, \mathrm{Q}(i, w, \gamma)$ is equivalent to $\ell\left(\left\lfloor w r_{\gamma}\right\rfloor\right)-\ell(w)=i-2 n$, by Lemmas 4.5 and 4.16. We see from (q-C) that $w$ and $\left\lfloor w r_{\gamma}\right\rfloor$ satisfy (1)-(5) in Step 1. As in Step 1, this gives $\ell\left(\left\lfloor w r_{\gamma}\right\rfloor\right)-\ell(w)=i-2 n+(w(\bar{i})-1)$. Since $w(\bar{i})=1$ by (q-C), we conclude that $\ell\left(\left\lfloor w r_{\gamma}\right\rfloor\right)-\ell(w)=i-2 n$.

The proof of Proposition 4.18 is complete.
Proof of Proposition 4.13. (1) and (3) follow by the same method as in the proof of Proposition 4.8.

We prove (2). Let $x, y \in\left(W^{I \backslash\{i\}}\right)_{\mathrm{af}}, \mathcal{Y}_{i}^{C_{n}}(x)=(\mathrm{T}, c)$, and $\mathcal{Y}_{i}^{C_{n}}(y)=\left(\mathrm{T}^{\prime}, c^{\prime}\right)$. By Proposition 4.19, we may assume that $d:=c^{\prime}-c \geqslant 0$. The proof is by induction on $d$.

If $d=0$, the assertion follows from Propositions 4.17 and 4.19.
Assume that $d>0$. It follows immediately from Proposition 4.19 that $x \preceq y$ implies $(\mathrm{T}, c) \preceq\left(\mathrm{T}^{\prime}, c^{\prime}\right)$. Conversely, we prove that ( $\left.\mathrm{T}, c\right) \preceq\left(\mathrm{T}^{\prime}, c^{\prime}\right)$ implies $x \preceq y$; assume that $\mathrm{T}(u) \preceq \mathrm{T}^{\prime}(u+d)$ for $u \in[i-d]$. To this end, we construct $x_{1}, x_{2} \in\left(W^{I \backslash\{i\}}\right)_{\mathrm{af}}$ and $\mathrm{T}_{1}, \mathrm{~T}_{2} \in \mathrm{CST}_{C_{n}}\left(\varpi_{i}\right)$ such that $\mathcal{Y}_{i}^{C_{n}}\left(x_{1}\right)=\left(\mathrm{T}_{1}, c^{\prime}\right), \mathcal{Y}_{i}^{C_{n}}\left(x_{2}\right)=\left(\mathrm{T}_{2}, c^{\prime}-1\right)$, and $x \preceq x_{2} \prec x_{1} \preceq y$ as follows. Let $s \in[0, i]$ be such that $\mathrm{T}^{\prime}(u)=\overline{i-u+1}$ for $u \in[s+1, i]$, and $\mathrm{T}^{\prime}(s) \prec \overline{i-s+1}$ if $s \neq 0$. Define $\mathrm{T}_{1}, \mathrm{~T}_{2} \in \mathrm{CST}_{C_{n}}\left(\varpi_{i}\right)$ by

$$
\begin{aligned}
& \mathrm{T}_{1}(u)= \begin{cases}1 & \text { if } u=1, \\
\mathrm{~T}^{\prime}(u) & \text { if } u \in[2, s], \\
i-u+2 & \text { if } u \in[\max \{2, s+1\}, i],\end{cases} \\
& \mathrm{T}_{2}(u)= \begin{cases}\mathrm{T}_{1}(u+1) & \text { if } u \in[i-1], \\
\overline{1} & \text { if } u=i .\end{cases}
\end{aligned}
$$

To see that $\mathrm{T}_{1}$ is well-defined, it suffices to show that $\left\|\mathrm{T}_{1}(u)\right\|, u \in[i]$, are all distinct. This follows from $\left\|\mathrm{T}_{1}(1)\right\|=1<\left\|\mathrm{T}_{1}(u)\right\| \leqslant i-s+1<\left\|\mathrm{T}_{1}(v)\right\|$ for $u \in[\max \{2, s+1\}, i]$ and $v \in[2, s]$. Let $x_{1}, x_{2} \in\left(W^{I \backslash\{i\}}\right)_{\text {af }}$ be such that $\mathcal{Y}_{i}^{C_{n}}\left(x_{1}\right)=\left(\mathrm{T}_{1}, c^{\prime}\right)$ and $\mathcal{Y}_{i}^{C_{n}}\left(x_{2}\right)=$ $\left(\mathrm{T}_{2}, c^{\prime}-1\right)$. Since $\mathrm{T}_{1}(u) \preceq \mathrm{T}^{\prime}(u)$ for $u \in[i]$, we see from the assertion for $d=0$ that $x_{1} \preceq y$. By Proposition $4.19\left(\frac{\infty}{2}\right.$-C5), we have $x_{2} \prec x_{1}$. By induction hypothesis, it remains to prove that $\mathrm{T}(u) \preceq \mathrm{T}_{2}(u+d-1)$ for $u \in[i-d+1]$. Let $u \in[i-d+1]$. If $u+d-1 \in[i-1] \cap[1, s-1]$, then $\mathrm{T}_{2}(u+d-1)=\mathrm{T}_{1}(u+d)=\mathrm{T}^{\prime}(u+d) \succeq \mathrm{T}(u)$. If $u+d-1 \in[i-1] \cap[\max \{2, s+1\}-1, i-1]$, then $\mathrm{T}_{2}(u+d-1)=\mathrm{T}_{1}(u+d)=$ $\overline{i-(u+d)+2} \succeq \mathrm{~T}(u+d-1) \succeq \mathbf{T}(u)$. We have $\mathrm{T}_{2}(i)=\overline{1} \succeq \mathrm{~T}(i-d+1)$.
4.5. Type $B_{n}^{(1)}$. Fix an integer $n \geqslant 3$. Set $I=[n]$. We assume that the labeling of the vertices of the Dynkin diagram of type $B_{n}$ is as follows.

Let $\varepsilon_{1}, \varepsilon_{2}, \ldots, \varepsilon_{n}$ be an orthonormal basis of an $n$-dimensional Euclidean space $\mathbb{R}^{n}$. Let $\Delta=\left\{ \pm\left(\varepsilon_{s} \pm \varepsilon_{t}\right) \mid s, t \in[n], s<t\right\} \sqcup\left\{ \pm \varepsilon_{s} \mid s \in[n]\right\}$ be a root system of type $B_{n}$, and let $\Pi=\left\{\alpha_{s}=\varepsilon_{s}-\varepsilon_{s+1} \mid s \in[n-1]\right\} \sqcup\left\{\alpha_{n}=\varepsilon_{n}\right\}$ be a simple root system of $\Delta$.

Let $W$ be the Weyl group of $\Delta$; we see from $\S 4.4$ that

$$
\begin{equation*}
W=\left\{w \in \mathfrak{S}\left(\mathcal{C}_{n}\right) \mid w(\sigma(s))=\sigma(w(s)) \text { for } s \in[n]\right\} \tag{80}
\end{equation*}
$$

Note that $r_{ \pm\left(\varepsilon_{s}-\varepsilon_{t}\right)}=(s t)(\bar{s} \bar{t}), r_{ \pm \varepsilon_{s}}=(s \bar{s})$, and $r_{ \pm\left(\varepsilon_{s}+\varepsilon_{t}\right)}=(s \bar{t})(\bar{s} t)$ for $s, t \in[n]$, $s<t$. Write $\operatorname{CST}_{B_{n}}\left(\varpi_{i}\right)=\operatorname{CST}_{C_{n}}\left(\varpi_{i}\right)$. We know from Lemmas 4.1-4.2 and 4.11 that the map

$$
\begin{equation*}
\mathcal{Y}_{i}^{B_{n}}: W_{\mathrm{af}} \rightarrow \operatorname{CST}_{B_{n}}\left(\varpi_{i}\right) \times \mathbb{Z}, w t_{\xi} \mapsto\left(\mathrm{T}_{w}^{(i)}, c_{i}(\xi)\right) \tag{81}
\end{equation*}
$$

induces a bijection from the subset $\left(W^{I \backslash\{i\}}\right)_{\text {af }} \subset W_{\text {af }}$ to $\operatorname{CST}_{B_{n}}\left(\varpi_{i}\right) \times \mathbb{Z}$.
Definition 4.20. Let $i \in I$, $(\mathrm{T}, c),\left(\mathrm{T}^{\prime}, c^{\prime}\right) \in \operatorname{CST}_{B_{n}}\left(\varpi_{i}\right) \times \mathbb{Z}$, and $d:=c^{\prime}-c$. Define a partial order $\preceq$ on $\operatorname{CST}_{B_{n}}\left(\varpi_{i}\right) \times \mathbb{Z}$ as follows.
(1) Assume that $i=1$. $\operatorname{Set}(\mathrm{T}, c) \preceq\left(\mathrm{T}^{\prime}, c^{\prime}\right)$ if either of the following holds:

$$
\begin{align*}
& (d \geqslant 2), \quad\left(d=1, \mathrm{~T}(1)=\overline{1}, \text { and } \mathrm{T}^{\prime}(1) \neq 1\right),  \tag{82}\\
& (d=1 \text { and } \mathrm{T}(1) \neq \overline{1}), \text { or }\left(d=0 \text { and } \mathrm{T}(1) \preceq \mathrm{T}^{\prime}(1) \text { in } \mathcal{C}_{n}\right) .
\end{align*}
$$

(2) Assume that $i \in[2, n-1]$. Set $(T, c) \preceq\left(\mathrm{T}^{\prime}, c^{\prime}\right)$ if

$$
\begin{equation*}
(d \geqslant 0),\left(\mathrm{T}(u) \preceq \mathrm{T}^{\prime}(u+d) \text { in } \mathcal{C}_{n} \text { for } u \in[i-d]\right), \tag{83}
\end{equation*}
$$

and one of the following conditions holds:
(i) $d$ is even.
(ii) $d$ is odd. If $d \in[i-1]$, then $\mathrm{T}(i-d) \preceq n$. If $d \in[i], \mathrm{T}(i-d+1) \succeq \bar{n}$, $\left\{a_{1}<a_{2}<\cdots<a_{n-i+d}\right\}=[n] \backslash\{\mathrm{T}(u) \mid u \in[i-d]\}$, and $\mathrm{T}(i-d+1)=$ $\overline{a_{d}}$, then $1 \prec a_{d} \prec \mathrm{~T}^{\prime}\left(a_{d}\right)$; note that $a_{d} \in[d, i]$ since $a_{u} \in[u, u+i-d]$ for $u \in[n-i+d]$.
(3) Assume that $i=n$. $\operatorname{Set}(\mathbf{T}, c) \preceq\left(\mathbf{T}^{\prime}, c^{\prime}\right)$ if

$$
\begin{equation*}
(d \geqslant 0) \text { and }\left(\mathrm{T}(u) \preceq \mathrm{T}^{\prime}(u+2 d) \text { in } \mathcal{C}_{n} \text { for } u \in[n-2 d]\right) . \tag{84}
\end{equation*}
$$

Proposition 4.21. Let $i \in I$.
(1) $\mathcal{Y}_{i}^{B_{n}} \circ \Pi^{I \backslash\{i\}}=\mathcal{Y}_{i}^{B_{n}}$.
(2) For $x, y \in W_{\text {af }}$, we have $\Pi^{I \backslash\{i\}}(x) \preceq \Pi^{I \backslash\{i\}}(y)$ in $\left(W^{I \backslash\{i\}}\right)_{\text {af }}$ if and only if $\mathcal{Y}_{i}^{B_{n}}(x) \preceq \mathcal{Y}_{i}^{B_{n}}(y)$ in $\operatorname{CST}_{B_{n}}\left(\varpi_{i}\right) \times \mathbb{Z}$.
(3) Let $i \in[n-1]$ and $(\mathrm{T}, c),\left(\mathrm{T}^{\prime}, c^{\prime}\right) \in \operatorname{CST}_{B_{n}}\left(\varpi_{i}\right) \times \mathbb{Z}$. If $c^{\prime}-c>i$, then $(\mathrm{T}, c) \preceq\left(\mathrm{T}^{\prime}, c^{\prime}\right)$.
(4) Let $i=n$ and $(\mathrm{T}, c),\left(\mathrm{T}^{\prime}, c^{\prime}\right) \in \mathrm{CST}_{B_{n}}\left(\varpi_{n}\right) \times \mathbb{Z}$. If $2\left(c^{\prime}-c\right) \geqslant i$, then $(\mathrm{T}, c) \preceq$ ( $\mathrm{T}^{\prime}, c^{\prime}$ ).

By combining Propositions 3.2 and 4.21 (2), we obtain the following tableau criterion for the semi-infinite Bruhat order on $W_{\text {af }}$ of type $B_{n}^{(1)}$.
THEOREM 4.22. Let $J \subset I$. For $x, y \in\left(W^{J}\right)_{\text {af }}$, we have $x \preceq y$ in $\left(W^{J}\right)_{\text {af }}$ if and only if $\mathcal{Y}_{i}^{B_{n}}(x) \preceq \mathcal{Y}_{i}^{B_{n}}(y)$ in $\operatorname{CST}_{B_{n}}\left(\varpi_{i}\right) \times \mathbb{Z}$ for all $i \in I \backslash J$.

The remainder of this subsection is devoted to the proof of Proposition 4.21.
The proofs of Lemmas 4.23-4.24 below are straightforward.

Lemma 4.23. Let $i \in I$ and $\gamma \in \Delta^{+} \backslash \Delta_{I \backslash\{i\}}^{+}$. We have $\gamma^{\vee} \in Q^{\vee, I \backslash\{i\}}$ if and only if one of the following conditions holds:
(1) $i=1$ and $\gamma^{\vee}=\varepsilon_{1}-\varepsilon_{2}=\alpha_{1}^{\vee}$.
(2) $i \in[2, n-1]$ and $\gamma^{\vee}=\varepsilon_{i}-\varepsilon_{i+1}=\alpha_{i}^{\vee}$.
(3) $i \in[2, n-1]$ and $\gamma^{\vee}=\varepsilon_{i-1}+\varepsilon_{i}=\alpha_{i-1}^{\vee}+2 \alpha_{i}^{\vee}+\cdots+2 \alpha_{n-1}^{\vee}+\alpha_{n}^{\vee}$.
(4) $i=n$ and $\gamma^{\vee}=\varepsilon_{n-1}+\varepsilon_{n}=\alpha_{n-1}^{\vee}+\alpha_{n}^{\vee}$.

Lemma 4.24. Let $i \in I$. We have

$$
2\left\langle\alpha_{i}^{\vee}, \rho-\rho_{I \backslash\{i\}}\right\rangle= \begin{cases}2 n-i & \text { if } i \in[n-1]  \tag{85}\\ 2 n & \text { if } i=n\end{cases}
$$

Proposition 4.25 (cf. [4, §8.1]). Let $i \in I, w \in W^{I \backslash\{i\}}$, and $\gamma \in \Delta^{+}$. There exists a Bruhat edge $w \xrightarrow{\gamma}\left\lfloor w r_{\gamma}\right\rfloor=w r_{\gamma}$ in $\mathrm{QB}^{I \backslash\{i\}}$ if and only if $\gamma \in \Delta^{+} \backslash \Delta_{I \backslash\{i\}}^{+}$and one of the following statements holds.
(b-B1) $i \in[n-1], c_{i}\left(\gamma^{\vee}\right)=1$, and there exists $s \in[i]$ such that $w r_{\gamma}(u)=w(u)$ for $u \in[i] \backslash\{s\}, 1 \preceq w(s) \prec n$, and $w r_{\gamma}(s)=\min ([w(s)+1, n] \backslash\{\|w(u)\| \mid u \in$ $[i], w(u) \succeq \bar{n}\})$; in this case, we have $\gamma^{\vee}=\varepsilon_{s}-\varepsilon_{t}=\alpha_{s}^{\vee}+\alpha_{s+1}^{\vee}+\cdots+\alpha_{t}^{\vee}$ for some $t \in[i+1, n]$.
(b-B2) $i \in[n-1], c_{i}\left(\gamma^{\vee}\right)=1$, and there exists $s \in[i]$ such that $w r_{\gamma}(u)=w(u)$ for $u \in[i] \backslash\{s\}, \bar{n} \preceq w(s) \prec \overline{1}$, and $w r_{\gamma}(s)=\sigma(\max ([\|w(s)\|-1] \backslash\{w(u) \mid u \in$ $[i], w(u) \preceq n\}))$; in this case, we have $\gamma^{\vee}=\varepsilon_{s}-\varepsilon_{t}=\alpha_{s}^{\vee}+\alpha_{s+1}^{\vee}+\cdots+\alpha_{t}^{\vee}$ for some $t \in[i+1, n]$.
(b-B3) $i \in[2, n-1], c_{i}\left(\gamma^{\vee}\right)=2$, and there exist $s, t \in[i]$ such that $s<t, w r_{\gamma}(u)=$ $w(u)$ for $u \in[i] \backslash\{s, t\}$ and $w r_{\gamma}(s)=w(s)+1=\sigma(w(t))=\sigma\left(w r_{\gamma}(t)\right)+1 \preceq n$; in this case, we have $\gamma^{\vee}=\varepsilon_{s}+\varepsilon_{t}=\alpha_{s}^{\vee}+\cdots+\alpha_{t-1}^{\vee}+2 \alpha_{t}^{\vee}+\cdots+2 \alpha_{n-1}^{\vee}+\alpha_{n}^{\vee}$.
(b-B4) $i=n, c_{n}\left(\gamma^{\vee}\right)=1$, and there exist $s, t \in[i]$ such that $s<t$, $w r_{\gamma}(u)=w(u)$ for $u \in[i] \backslash\{s, t\}$ and $w r_{\gamma}(s)=w(s)+1=\sigma(w(t))=\sigma\left(w r_{\gamma}(t)\right)+1 \preceq n$; in this case, we have $\gamma^{\vee}=\varepsilon_{s}+\varepsilon_{t}=\alpha_{s}^{\vee}+\cdots+\alpha_{t-1}^{\vee}+2 \alpha_{t}^{\vee}+\cdots+2 \alpha_{n-1}^{\vee}+\alpha_{n}^{\vee}$.
(b-B5) $i \in[n-1], c_{i}\left(\gamma^{\vee}\right)=2$, and there exists $s \in[i]$ such that $w r_{\gamma}(u)=w(u)$ for $u \in[i] \backslash\{s\}$ and $\sigma\left(w r_{\gamma}(s)\right)=w(s)=n$; in this case, we have $\gamma^{\vee}=\varepsilon_{s}=$ $2 \alpha_{s}^{\vee}+2 \alpha_{s+1}^{\vee}+\cdots+2 \alpha_{n-1}^{\vee}+\alpha_{n}^{\vee}$.
(b-B6) $i=n, c_{n}\left(\gamma^{\vee}\right)=1$, and there exists $s \in[i]$ such that $w r_{\gamma}(u)=w(u)$ for $u \in[i] \backslash\{s\}$ and $\sigma\left(w r_{\gamma}(s)\right)=w(s)=n$; in this case, we have $\gamma^{\vee}=\varepsilon_{s}=$ $2 \alpha_{s}^{\vee}+2 \alpha_{s+1}^{\vee}+\cdots+2 \alpha_{n-1}^{\vee}+\alpha_{n}^{\vee}$.
Moreover, for $w, v \in W^{I \backslash\{i\}}$, we have $w \preceq v$ if and only if $w(u) \preceq v(u)$ for $u \in[i]$.
For $i \in I, w \in W^{I \backslash\{i\}}$ and $\gamma \in \Delta^{+} \backslash \Delta_{I \backslash\{i\}}^{+}$, let $\mathrm{Q}(i, w, \gamma)$ denote the following statement.
$\mathrm{Q}(i, w, \gamma)$ : There exists a quantum edge $w \xrightarrow{\gamma}\left\lfloor w r_{\gamma}\right\rfloor$ in $\mathrm{QB}^{I \backslash\{i\}}$.
Proposition 4.26. Let $i \in I, w \in W^{I \backslash\{i\}}$, and $\gamma \in \Delta^{+} \backslash \Delta_{I \backslash\{i\}}^{+}$. Then $\mathrm{Q}(i, w, \gamma)$ is true if and only if one of the following statements holds.
(q-B1) $i=1, c_{1}\left(\gamma^{\vee}\right)=1$, and $\left(w(1),\left\lfloor w r_{\gamma}\right\rfloor(1)\right) \in\{(\overline{1}, 2),(\overline{2}, 1)\}$; in this case, we have $\gamma^{\vee}=\varepsilon_{1}-\varepsilon_{2}=\alpha_{1}^{\vee}$
(q-B2) $i \in[2, n-1], c_{i}\left(\gamma^{\vee}\right)=1$, and $1 \prec w(\bar{i}) \preceq i+1$. If we set $k=w(\bar{i})$, then $w(u)=u+1$ for $u \in[k-2], k \prec w(u) \preceq n$ for $u \in[k-1, i-1],\left\lfloor w r_{\gamma}\right\rfloor(1)=1$, and $\left\lfloor w r_{\gamma}\right\rfloor(u)=w(u-1)$ for $u \in[2, i]$; in this case, we have $\gamma^{\vee}=\varepsilon_{i}-\varepsilon_{i+1}=$ $\alpha_{i}^{\vee}$.
(q-B3) $i \in[2, n-1], c_{i}\left(\gamma^{\vee}\right)=2,\left\lfloor w r_{\gamma}\right\rfloor(1)=w(\bar{i})=1,\left\lfloor w r_{\gamma}\right\rfloor(2)=w(\overline{i-1})=2$, and $\left\lfloor w r_{\gamma}\right\rfloor(u)=w(u-2)$ for $u \in[3, i]$; in this case, we have $\gamma^{\vee}=\varepsilon_{i-1}+\varepsilon_{i}=$ $\alpha_{i-1}^{\vee}+2 \alpha_{i}^{\vee}+\cdots+2 \alpha_{n-1}^{\vee}+\alpha_{n}^{\vee}$.
$(\mathrm{q}-\mathrm{B} 4) i=n, c_{n}\left(\gamma^{\vee}\right)=1,\left\lfloor w r_{\gamma}\right\rfloor(1)=w(\bar{n})=1,\left\lfloor w r_{\gamma}\right\rfloor(2)=w(\overline{n-1})=2$, and $\left\lfloor w r_{\gamma}\right\rfloor(u)=w(u-2)$ for $u \in[3, n]$; in this case, we have $\gamma^{\vee}=\varepsilon_{n-1}+\varepsilon_{n}=$ $\alpha_{n-1}^{\vee}+\alpha_{n}^{\vee}$.

Before starting the proof of Proposition 4.26, we mention a consequence of Lemma 4.3 and Propositions 4.25-4.26.

Proposition 4.27. Let $i \in I, x, y \in\left(W^{I \backslash\{i\}}\right)_{\mathrm{af}}, \mathcal{Y}_{i}^{B_{n}}(x)=(\mathrm{T}, c)$, and $\mathcal{Y}_{i}^{B_{n}}(y)=$ $\left(\mathrm{T}^{\prime}, c^{\prime}\right)$. There exists an edge $x \xrightarrow{\beta} y$ in $\mathrm{SiB}^{I \backslash\{i\}}$ for some $\beta \in \Delta_{\mathrm{af}}^{+}$if and only if one of the following conditions holds:
$\left(\frac{\infty}{2}-\mathrm{B} 1\right) i \in[n-1], c^{\prime}=c$, and there exists $s \in[i]$ such that $\mathrm{T}^{\prime}(u)=\mathrm{T}(u)$ for $u \in[i] \backslash\{s\}, 1 \preceq \mathrm{~T}(s) \prec n$, and $\mathrm{T}^{\prime}(s)=\min ([\mathrm{T}(s)+1, n] \backslash\{\|\mathrm{T}(u)\| \mid u \in$ [i], $\mathrm{T}(u) \succeq \bar{n}\})$.
$\left(\frac{\infty}{2}\right.$-B2) $i \in[n-1], c^{\prime}=c$, and there exists $s \in[i]$ such that $\mathrm{T}^{\prime}(u)=\mathrm{T}(u)$ for $u \in[i] \backslash\{s\}, \bar{n} \preceq \mathrm{~T}(s) \prec \overline{1}$, and $\mathrm{T}^{\prime}(s)=\sigma(\max ([\|\mathrm{T}(s)\|-1] \backslash\{\mathrm{T}(u) \mid u \in$ [i], $\mathrm{T}(u) \preceq n\}))$.
$\left(\frac{\infty}{2}\right.$-B3) $i \in[2, n], c^{\prime}=c$, and there exist $s, t \in[i]$ such that $s<t, \mathrm{~T}^{\prime}(u)=\mathrm{T}(u)$ for $u \in[i] \backslash\{s, t\}$, and $\mathrm{T}^{\prime}(s)=\mathrm{T}(s)+1=\sigma(\mathrm{T}(t))=\sigma\left(\mathrm{T}^{\prime}(t)\right)+1 \preceq n$.
$\left(\frac{\infty}{2}-\mathrm{B} 4\right) c^{\prime}=c$, and there exists $s \in[i]$ such that $\mathrm{T}^{\prime}(u)=\mathrm{T}(u)$ for $u \in[i] \backslash\{s\}$ and $\sigma\left(\mathrm{T}^{\prime}(s)\right)=\mathrm{T}(s)=n$.
$\left(\frac{\infty}{2}-\mathrm{B} 5\right) \quad i=1, c^{\prime}=c+1$, and $\left(\mathrm{T}(1), \mathrm{T}^{\prime}(1)\right) \in\{(\overline{1}, 2),(\overline{2}, 1)\}$.
$\left(\frac{\infty}{2}\right.$-B6) $i \in[2, n-1], c^{\prime}=c+1$, and $1 \prec \sigma(\mathrm{~T}(i)) \preceq i+1$. If we set $k=\sigma(\mathrm{T}(i))$, then $\mathrm{T}(u)=u+1$ for $u \in[k-2], k \prec \mathrm{~T}(u) \preceq n$ for $u \in[k-1, i-1], \mathrm{T}^{\prime}(1)=1$, and $\mathrm{T}^{\prime}(u)=\mathrm{T}(u-1)$ for $u \in[2, i]$.
$\left(\frac{\infty}{2}-\mathrm{B} 7\right) i \in[2, n-1], c^{\prime}=c+2, \mathrm{~T}^{\prime}(1)=\sigma(\mathrm{T}(i))=1, \mathrm{~T}^{\prime}(2)=\sigma(\mathrm{T}(i-1))=2$, and $\mathrm{T}^{\prime}(u)=\mathrm{T}(u-2)$ for $u \in[3, i]$.
$\left(\frac{\infty}{2}\right.$-B8) $i=n, c^{\prime}=c+1, \mathrm{~T}^{\prime}(1)=\sigma(\mathrm{T}(n))=1, \mathrm{~T}^{\prime}(2)=\sigma(\mathrm{T}(n-1))=2$, and $\mathrm{T}^{\prime}(u)=\mathrm{T}(u-2)$ for $u \in[3, n]$.

We have divided the proof of Proposition 4.26 into a sequence of lemmas.
Lemma 4.28. $\mathrm{Q}(1, w, \gamma)$ implies $(\mathrm{q}-\mathrm{B} 1)$.
Proof. Assume that $\mathrm{Q}(1, w, \gamma)$ is true. By Lemmas 4.4 and 4.23 , we have $\gamma^{\vee}=\varepsilon_{1}-\varepsilon_{2} \in$ $Q^{\vee, I \backslash\{1\}}, r_{\gamma}=\left(\begin{array}{ll}1 & 2\end{array}\right)(\overline{1} \overline{2})$, and $\left\lfloor w r_{\gamma}\right\rfloor=w r_{\gamma}\left(z_{\gamma}^{I} \backslash\{1\}\right)^{-1}$. Set $J=I \backslash\{1\}=[2, n]$; note that $J$ is of type $B_{n-1}$. We see that $2 \in J_{\text {af }}$ satisfies the condition for $\gamma^{\vee} \in Q^{\vee}$ in Lemma 4.1; note that $J \backslash\{2\}=[3, n]$ is of type $B_{n-2}$. Hence $z_{\gamma^{\vee}}^{J}=w_{0}^{J} w_{0}^{J \backslash\{2\}}=(2 \overline{2})$ and $\left\lfloor w r_{\gamma}\right\rfloor=w(12)(\overline{1} \overline{2})(2 \overline{2})=w(12 \overline{1} \overline{2})$. From this we obtain $\left\lfloor w r_{\gamma}\right\rfloor(1)=w(2)$, $\left\lfloor w r_{\gamma}\right\rfloor(2)=w(\overline{1})$, and $\left\lfloor w r_{\gamma}\right\rfloor(u)=w(u)$ for $u \in[3, n]$. It follows from Lemma 4.11 that

$$
\begin{equation*}
\max \{w(\overline{1}), w(2)\} \prec w(3) \prec w(4) \prec \cdots \prec w(n) \preceq n . \tag{86}
\end{equation*}
$$

Hence $\left\lfloor w r_{\gamma}\right\rfloor(u)=w(u)=u$ for $u \in[3, n]$. If $w(\overline{1}) \prec w(2)$, then $\left(w(1),\left\lfloor w r_{\gamma}\right\rfloor(1)\right)=$ $(\overline{1}, 2)$. If $w(2) \prec w(\overline{1})$, then $\left(w(1),\left\lfloor w r_{\gamma}\right\rfloor(1)\right)=(\overline{2}, 1)$.

Lemma 4.29. ( $\mathrm{q}-\mathrm{B} 1$ ) implies $\mathrm{Q}(1, w, \gamma)$.
Proof. Assume that ( $\mathrm{q}-\mathrm{B} 1$ ) is true. We see from Lemmas 4.5 and 4.23-4.24 that $\mathrm{Q}(1, w, \gamma)$ is equivalent to $\ell\left(\left\lfloor w r_{\gamma}\right\rfloor\right)-\ell(w)=2-2 n$. Note that (q-B1) and Lemma 4.11 yield (86).

If $\left(w(1),\left\lfloor w r_{\gamma}\right\rfloor(1)\right)=(\overline{1}, 2)$, then $w=(1 \overline{1})$ and $\left\lfloor w r_{\gamma}\right\rfloor=(12)(\overline{1} \overline{2})=r_{1}$, by Lemma 4.11. Since $\ell\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=1$ and $\ell(w)=\mathrm{a}_{1}(w)+\mathrm{b}_{1}(w)+\mathrm{e}_{1}(w)=(n-1)+(n-1)+1=$ $2 n-1$, we have $\ell\left(\left\lfloor w r_{\gamma}\right\rfloor\right)-\ell(w)=2-2 n$.

If $\left(w(1),\left\lfloor w r_{\gamma}\right\rfloor(1)\right)=(\overline{2}, 1)$, then $w=(1 \overline{2} \overline{1} 2)$ and $\left\lfloor w r_{\gamma}\right\rfloor=e$, by Lemma 4.11. Since $\ell\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=0$ and $\ell(w)=\mathrm{a}_{1}(w)+\mathrm{b}_{1}(w)+\mathrm{e}_{1}(w)=(n-1)+(n-2)+1=2 n-2$, we have $\ell\left(\left\lfloor w r_{\gamma}\right\rfloor\right)-\ell(w)=2-2 n$.

Lemma 4.30. $i \in[2, n-1], c_{i}\left(\gamma^{\vee}\right)=1$, and $\mathrm{Q}(i, w, \gamma)$ imply ( $\mathrm{q}-\mathrm{B} 2$ ).
Proof. Assume that $i \in[2, n-1]$ and $c_{i}\left(\gamma^{\vee}\right)=1$, and that $\mathrm{Q}(i, w, \gamma)$ is true. By Lemmas 4.4 and 4.23 , we have $\gamma^{\vee}=\varepsilon_{i}-\varepsilon_{i+1} \in Q^{\vee, I \backslash\{i\}}, r_{\gamma}=(i i+1)(\bar{i} \overline{i+1})$, and $\left\lfloor w r_{\gamma}\right\rfloor=w r_{\gamma}\left(z_{\gamma^{\vee}}^{I \backslash\{i\}}\right)^{-1}$. We see from Lemmas 4.5 and 4.24 that $\mathrm{Q}(i, w, \gamma)$ is equivalent to $\ell\left(\left\lfloor w r_{\gamma}\right\rfloor\right)-\ell(w)=i-2 n+1$. Let $I \backslash\{i\}=I_{1} \sqcup I_{2}$, where $I_{1}=[i-1]$ is of type $A_{i-1}$ and $I_{2}=[i+1, n]$ is of type $B_{n-i}$. We see that $(i-1, i+1) \in\left(I_{1}\right)_{\text {af }} \times\left(I_{2}\right)_{\text {af }}$ satisfies the condition for $\gamma^{\vee} \in Q^{\vee}$ in Lemma 4.1; note that $I_{1} \backslash\{i-1\}=[i-2]$ is of type $A_{i-2}$ and $I_{2} \backslash\{i+1\}=[i+2, n]$ is of type $B_{n-i-1}$. Hence $z_{\gamma^{\vee}}^{I \backslash\{i\}}=$ $w_{0}^{I_{1}} w_{0}^{I_{1} \backslash\{i-1\}} w_{0}^{I_{2}} w_{0}^{I_{2} \backslash\{i+1\}}=(12 \cdots i)(\overline{1} \overline{2} \cdots \bar{i})(i+1 \overline{i+1})$ and $\left\lfloor w r_{\gamma}\right\rfloor=w(i i+$ 1) $(\bar{i} \overline{i+1})(i+1 \overline{i+1})(i \cdots 21)(\bar{i} \cdots \overline{2} \overline{1})=w(i i+1 \bar{i} \overline{i+1})(i \cdots 21)(\bar{i} \cdots \overline{2} \overline{1})$. We have $\left\lfloor w r_{\gamma}\right\rfloor(1)=w(i+1),\left\lfloor w r_{\gamma}\right\rfloor(u)=w(u-1)$ for $u \in[2, i],\left\lfloor w r_{\gamma}\right\rfloor(i+1)=w(\bar{i})$, and $\left\lfloor w r_{\gamma}\right\rfloor(u)=w(u)$ for $u \in[i+2, n]$. It follows from Lemma 4.11 that

$$
\begin{align*}
& w(i+1) \prec w(1) \prec w(2) \prec \cdots \prec w(i-1) \prec w(i), \\
& \max \{w(\bar{i}), w(i+1)\} \prec w(i+2) \prec w(i+3) \prec \cdots \prec w(n) \preceq n \prec w(i) . \tag{87}
\end{align*}
$$

Hence $w(\bar{i}) \preceq i+1$. Set $k=w(\bar{i})=\left\lfloor w r_{\gamma}\right\rfloor(i+1)$. The rest of the proof will be divided into four steps.

Step 1. We claim that $k \succ 1$ and (1)-(5) below imply (q-B2). Let $l \in[k-1, i]$ be such that $w(l-1) \preceq n \prec w(l)$.
(1) $\mathrm{a}_{1}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=\mathrm{b}_{1}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=\mathrm{e}_{1}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=0$,
(2) $\mathrm{a}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=\mathrm{a}_{s-1}(w)-1$ for $s \in[2, k-1], \mathrm{a}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=\mathrm{a}_{s-1}(w)$ for $s \in[k, i]$,
(3) $\mathrm{b}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=\mathrm{b}_{s-1}(w)$ for $s \in[2, k-1] \cup[l+1, i], \mathrm{b}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=\mathrm{b}_{s-1}(w)-1$ for $s \in[k, l]$,
(4) $\mathrm{e}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=\mathrm{e}_{s-1}(w)$ for $s \in[2, i]$,
(5) $\mathrm{a}_{i}(w)=n-i, \mathrm{~b}_{i}(w)=n-i-1, \mathrm{e}_{i}(w)=1$.

Indeed, if $k \succ 1$, then $\left\lfloor w r_{\gamma}\right\rfloor(u)=u$ for $u \in[k-1]$, by (87), Lemma 4.11, and $\left\lfloor w r_{\gamma}\right\rfloor(i+1)=k$. Therefore $w(u)=\left\lfloor w r_{\gamma}\right\rfloor(u+1)=u+1$ for $u \in[k-2]$. It follows from $w(1)=2$ and (87) that $\left\lfloor w r_{\gamma}\right\rfloor(1)=w(i+1)=1$. Also, by (87), we have $k-1=w(k-2) \prec w(u) \prec w(i)=\bar{k}$ for $u \in[k-1, i-1]$, which implies $\|w(u)\|>k$ for $u \in[k-1, i-1]$. It remains to prove that $w(u) \preceq n$ for $u \in[k-1, i-1]$; we only need to show that $l=i$. It follows from Lemma 4.11 and (1)-(5) above that $\ell\left(\left\lfloor w r_{\gamma}\right\rfloor\right)-\ell(w)=i-2 n+1+(i-l)$. Since $\ell\left(\left\lfloor w r_{\gamma}\right\rfloor\right)-\ell(w)=i-2 n+1$, we get $l=i$.

Step 2. We prove (1)-(5) in Step 1 under the assumption that $k \succ 1$.
(1) follows from $\left\lfloor w r_{\gamma}\right\rfloor(1)=1$.
(2): If $s \in[2, k-1]$, then $\mathrm{A}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=\varnothing$ and $\mathrm{A}_{s-1}(w)=\{i+1\}$, which implies $\mathrm{a}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=\mathrm{a}_{s-1}(w)-1$. If $s \in[k, i]$, then $\mathrm{A}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=\mathrm{A}_{s}(w)$, which implies $\mathrm{a}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=\mathrm{a}_{s-1}(w)$.
(3): If $s \in[2, k-1]$, then $\mathrm{B}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=\mathrm{B}_{s-1}(w)=\varnothing$, which implies $\mathrm{b}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=$ $\mathrm{b}_{s-1}(w)$. If $s \in[k, l]$, then $k \prec\left\lfloor w r_{\gamma}\right\rfloor(s)=w(s-1) \preceq n, i \in \mathrm{~B}_{s-1}(w)$, and the map $\mathrm{B}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right) \rightarrow \mathrm{B}_{s-1}(w) \backslash\{i\}, t \mapsto t-1$, is bijective. This implies $\mathrm{b}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=$ $\mathrm{b}_{s-1}(w)-1$. If $s \in[l+1, i]$, then $\bar{n} \preceq\left\lfloor w r_{\gamma}\right\rfloor(s)=w(s-1)$ and $\mathrm{B}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=\mathrm{B}_{s-1}(w)$, which implies $\mathrm{b}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=\mathrm{b}_{s-1}(w)$.
(4) follows from $\left\lfloor w r_{\gamma}\right\rfloor(s)=w(s-1)$ for $s \in[2, i]$.
(5): Lemma 4.11 and $w(i)=\bar{k} \succeq \bar{n}$ show that $\mathrm{a}_{i}(w)=n-i$ and $\mathrm{e}_{i}(w)=1$. We see from $\|w(s)\|>k=\|w(i)\|$ for $s \in[k-1, i-1]$ that $\mathrm{b}_{i}(w)=n-i-1$.
Step 3. It remains to prove that $k \succ 1$. On the contrary, suppose that $k=1$. Then $w(\bar{i})=k \prec w(i+1) \preceq n$. If we prove that
(6) $\mathrm{e}_{1}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=0, \mathrm{e}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=\mathrm{e}_{s-1}(w)$ for $s \in[2, i]$, and $\mathrm{e}_{i}(w)=1$,
(7) $\mathrm{a}_{i}(w)=n-i$,
(8) $\mathrm{a}_{1}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=1, \mathrm{~b}_{1}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=w(i+1)-2$,
(9) $\mathrm{a}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=\mathrm{a}_{s-1}(w)$ for $s \in[2, i]$,
(10) $\mathrm{b}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=\mathrm{b}_{s-1}(w)-1$ for $s \in[2, i]$,
(11) $\mathrm{b}_{i}(w)=n-i$,
then $\ell\left(\left\lfloor w r_{\gamma}\right\rfloor\right)-\ell(w)=i-2 n+1+(w(i+1)+2 i-4)$. Since $\ell\left(\left\lfloor w r_{\gamma}\right\rfloor\right)-\ell(w)=i-2 n+1$ and $i \geqslant 2$, we have $w(i+1)=4-2 i \leqslant 0$, a contradiction.
Step 4. We prove (6)-(11) in Step 3 under the assumption that $k=1$; in fact, we do not use $k=1$ to prove (6)-(7).
(6) follows from (87) and $\left\lfloor w r_{\gamma}\right\rfloor(u)=w(u-1)$ for $u \in[2, i]$.
(7): We deduce from (87) that $\mathrm{A}_{i}(w)=[i+1, n]$, which gives $\mathrm{a}_{i}(w)=n-i$.
(8): By Lemma 4.11, $\mathrm{A}_{1}\left(\left\lfloor w r_{\gamma}\right\rfloor\right) \subset[i+1, n]$. Since $\left\lfloor w r_{\gamma}\right\rfloor(1)=w(i+1) \succ w(\bar{i})=$ $\left\lfloor w r_{\gamma}\right\rfloor(i+1)$, we have $i+1 \in \mathrm{~A}_{1}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)$. Since $\left\lfloor w r_{\gamma}\right\rfloor(t)=w(t)$ for $t \in[i+2, n]$, we have $\mathrm{A}_{1}\left(\left\lfloor w r_{\gamma}\right\rfloor\right) \cap[i+2, n]=\varnothing$. Hence $\mathrm{A}_{1}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=\{i+1\}$ and $\mathrm{a}_{1}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=1$ as claimed. Since $\left\lfloor w r_{\gamma}\right\rfloor(1)=w(i+1) \prec \overline{1}=w(i)=\sigma\left(\left\lfloor w r_{\gamma}\right\rfloor(i+1)\right)$, we have $i+1 \notin \mathrm{~B}_{1}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)$. Therefore

$$
\begin{aligned}
\mathrm{B}_{1}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)= & \{t \in[2, i] \mid \underbrace{\left\lfloor w r_{\gamma}\right\rfloor(1)}_{=w(i+1)} \succ \underbrace{\sigma\left(\left\lfloor w r_{\gamma}\right\rfloor(t)\right)}_{=\sigma(w(t-1))}\} \\
& \sqcup\{t \in[i+2, n] \mid \underbrace{\left\lfloor w r_{\gamma}\right\rfloor(1)}_{=w(i+1)} \succ \underbrace{\sigma\left(\left\lfloor w r_{\gamma}\right\rfloor(t)\right)}_{=\sigma(w(t))}\} .
\end{aligned}
$$

It follows that the map

$$
[2, n] \rightarrow[n], t \mapsto \begin{cases}t-1 & \text { if } t \in[2, i] \\ t & \text { if } t \in[i+1, n]\end{cases}
$$

induces a bijection from $\mathrm{B}_{1}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)$ to $\{t \in[n] \mid w(i+1) \succ \sigma(w(t))\} \backslash\{i\}$. Since $w(i+1)=\min \{w(u) \mid u \in[n]\}$, the latter set equals

$$
\left\{w^{-1}(\overline{2}), w^{-1}(\overline{3}), \ldots, w^{-1}(\overline{w(i+1)-1})\right\}
$$

This proves $\mathrm{b}_{1}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=w(i+1)-2$.
(9): Let $s \in[2, i]$. Since $\left\lfloor w r_{\gamma}\right\rfloor(i+1)=1$ and $w(i+1)=\min \{w(u) \mid u \in[n]\}$, we have $i+1 \in \mathrm{~A}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)$ and $i+1 \in \mathrm{~A}_{s-1}(w)$. It follows from Lemma 4.11 that

$$
\mathrm{A}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=\{i+1\} \sqcup\{t \in[i+2, n\rfloor \mid \underbrace{\left\lfloor w r_{\gamma}\right\rfloor(s)}_{=w(s-1)} \succ \underbrace{\sigma\left(\left\lfloor w r_{\gamma}\right\rfloor(t)\right)}_{=w(t)}\}=\mathrm{A}_{s-1}(w),
$$

which implies $\mathrm{a}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=\mathrm{a}_{s-1}(w)$.
(10): Let $s \in[2, i]$. Since $\left\lfloor w r_{\gamma}\right\rfloor(i+1)=w(\bar{i})=\overline{1}$, we have $\sigma\left(\left\lfloor w r_{\gamma}\right\rfloor(i+1)\right) \succ$ $\left\lfloor w r_{\gamma}\right\rfloor(s)$. Therefore $i+1 \notin \mathrm{~B}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)$ and

$$
\begin{aligned}
\mathrm{B}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)= & \left(\mathrm{B}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right) \cap[s+1, i]\right) \sqcup\left(\mathrm{B}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right) \cap[i+2, n]\right) \\
= & \{t \in[s+1, i] \mid \underbrace{\left\lfloor w r_{\gamma}\right\rfloor(s)}_{=w(s-1)} \prec \underbrace{\sigma\left(\left\lfloor w r_{\gamma}\right\rfloor(t)\right)}_{=\sigma(w(t-1))}\} \\
& \sqcup\{t \in[i+2, n] \mid \underbrace{\left\lfloor w r_{\gamma}\right\rfloor(s)}_{=w(s-1)} \prec \underbrace{\sigma\left(\left\lfloor w r_{\gamma}\right\rfloor(t)\right)}_{=\sigma(w(t))}\} .
\end{aligned}
$$

Also, $w(\overline{1})=1$ implies $i \in \mathrm{~B}_{s-1}(w)$. It follows that the map

$$
[s+1, n] \rightarrow[s, n], t \mapsto \begin{cases}t-1 & \text { if } t \in[s+1, i] \\ t & \text { if } t \in[i+1, n]\end{cases}
$$

induces a bijection from $\mathrm{B}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)$ to $\mathrm{B}_{s-1}(w) \backslash\{i\}$, which implies $\mathrm{b}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=$ $\mathrm{b}_{s-1}(w)-1$.
(11): Since $w(i)=\overline{1}$, we have $\mathrm{B}_{i}(w)=\{t \in[i+1, n] \mid w(i) \succ \sigma(w(t))\}=[i+1, n]$. This proves $\mathrm{b}_{i}(w)=n-i$ as claimed.

The proof of Lemma 4.30 is complete.
Lemma 4.31. ( q -B2) implies $\mathrm{Q}(i, w, \gamma)$.
Proof. Assume that (q-B2) is true; note that $c_{i}\left(\gamma^{\vee}\right)=1$ and (87) in the proof of Lemma 4.30 holds. We see from Lemmas 4.5 and 4.24 that $\mathrm{Q}(i, w, \gamma)$ is equivalent to $\ell\left(\left\lfloor w r_{\gamma}\right\rfloor\right)-\ell(w)=i-2 n+1$. If we prove that
(1) $\mathrm{e}_{1}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=0, \mathrm{e}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=\mathrm{e}_{s-1}(w)$ for $s \in[2, i]$, and $\mathrm{e}_{i}(w)=1$,
(2) $\mathrm{a}_{i}(w)=n-i$,
(3) $\mathrm{a}_{1}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=\mathrm{b}_{1}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=0$,
(4) $\mathrm{b}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=\left\{\begin{array}{ll}\mathrm{b}_{s-1}(w) & \text { if } w(s-1) \prec w(\bar{i}), \\ \mathrm{b}_{s-1}(w)-1 & \text { if } w(s-1) \succ w(\bar{i})\end{array}\right.$ for $s \in[2, i]$,
(5) $\mathrm{a}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=\left\{\begin{array}{ll}\mathrm{a}_{s-1}(w)-1 & \text { if } w(s-1) \prec w(\bar{i}), \\ \mathrm{a}_{s-1}(w) & \text { if } w(s-1) \succ w(\bar{i})\end{array}\right.$ for $s \in[2, i]$,
(6) $\mathrm{b}_{i}(w)=n-i+1$,
then $\ell\left(\left\lfloor w r_{\gamma}\right\rfloor\right)-\ell(w)=i-2 n+1$ by Lemma 4.11, which is our assertion. We prove (1)-(6) as follows.
(1)-(2) follow by the same method as in Step 4 of the proof of Lemma 4.30.
(3): Since $\left\lfloor w r_{\gamma}\right\rfloor(1)=1$, we have $\mathrm{A}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=\mathrm{B}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=\varnothing$ and $\mathrm{a}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=$ $\mathrm{b}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=0$.
(4): Let $s \in[2, i]$. We first claim that $i+1 \notin \mathrm{~B}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)$. Indeed, we see from (q-B2) that $[k-1] \subset\left\{\left\lfloor w r_{\gamma}\right\rfloor(u) \mid u \in[i]\right\}$ and $k \notin\left\{\left\lfloor w r_{\gamma}\right\rfloor(u) \mid u \in[i]\right\}$. By Lemma 4.11, we have

$$
\left\lfloor w r_{\gamma}\right\rfloor(i+1)=\min \left([n] \backslash\left\{\left\lfloor w r_{\gamma}\right\rfloor(u) \mid u \in[i]\right\}\right)=k=w(\bar{i}) .
$$

Since $\left\lfloor w r_{\gamma}\right\rfloor(s)=w(s-1) \preceq n \prec \bar{k}=w(i)=\sigma\left(\left\lfloor w r_{\gamma}\right\rfloor(i+1)\right)$, we have $i+1 \notin$ $\mathrm{B}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)$ as claimed. It follows that

$$
\begin{aligned}
\mathrm{B}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)= & \{t \in[s+1, i] \mid \underbrace{\left\lfloor w r_{\gamma}\right\rfloor(s)}_{=w(s-1)} \succ \underbrace{\sigma\left(\left\lfloor w r_{\gamma}\right\rfloor(t)\right.}_{=\sigma(w(t-1))}\} \\
& \sqcup\{t \in[i+2, n] \mid \underbrace{\left\lfloor w r_{\gamma}\right\rfloor(s)}_{=w(s-1)} \succ \underbrace{\left\lfloor w r_{\gamma}\right\rfloor(t)}_{=\sigma(w(t))}\} .
\end{aligned}
$$

We next claim that $i+1 \notin \mathrm{~B}_{s-1}(w)$. We see from Lemma 4.11 that $w(i+1)=1$. Hence $\sigma(w(i+1))=\overline{1} \succ w(s-1)$, which implies $i+1 \notin \mathrm{~B}_{s-1}(w)$ as claimed. Note that $i \in \mathrm{~B}_{s-1}(w)$ if and only if $w(s-1) \succ w(\bar{i})$. It follows that the map

$$
[s+1, n] \rightarrow[s, n], t \mapsto \begin{cases}t-1 & \text { if } t \in[s+1, i] \\ t & \text { if } t \in[i+1, n]\end{cases}
$$

induces a bijection from $\mathrm{B}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)$ to $\mathrm{B}_{s-1}(w)$ (resp. from $\mathrm{B}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)$ to $\mathrm{B}_{s-1}(w) \backslash$ $\{i\}$ ) if $w(s-1) \prec w(\bar{i})$ (resp. if $w(s-1) \succ w(\bar{i}))$. This proves (4).
(5): Let $s \in[2, i]$. Since $\left\lfloor w r_{\gamma}\right\rfloor(i+1)=w(\bar{i})$, we have $i+1 \in \mathrm{~A}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)$ if and only if $w(s-1) \succ w(\bar{i})$. It follows from Lemma 4.11 and $\left\lfloor w r_{\gamma}\right\rfloor(t)=w(t)$ for $t \in[i+2, n]$ that $\mathrm{A}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=\mathrm{A}_{s-1}(w) \backslash\{i+1\}\left(\right.$ resp. $\left.\mathrm{A}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=\mathrm{A}_{s-1}(w)\right)$ if $w(s-1) \prec w(\bar{i})$ (resp. if $w(s-1) \succ w(\bar{i}))$. This prove (5).
(6): By Lemma 4.11 and (87), we have $w(i+1)=1$. Hence $w(i) \prec \overline{1}=\sigma(w(i+1))$ and $i+1 \notin \mathrm{~B}_{s}(w)$. Also, we see from (87) that $w(i) \succ \sigma(w(t))$ for $t \in[i+2, n]$, and consequently $\mathrm{B}_{s}(w)=[i+2, n]$. This proves (6).

Lemma 4.32. $i \in[2, n-1], c_{i}\left(\gamma^{\vee}\right)=2$, and $\mathrm{Q}(i, w, \gamma)$ imply ( $\mathrm{q}-\mathrm{B} 3$ ).
Proof. Assume that $i \in[2, n-1]$ and $c_{i}\left(\gamma^{\vee}\right)=2$, and that $\mathrm{Q}(i, w, \gamma)$ is true. We see from Lemmas 4.5 and 4.24 that $\mathrm{Q}(i, w, \gamma)$ is equivalent to $\ell\left(\left\lfloor w r_{\gamma}\right\rfloor\right)-\ell(w)=2 i-4 n+1$. By the same argument as in Step 2 of the proof of Proposition 4.18 in $\S 4.4$, we have $\left\lfloor w r_{\gamma}\right\rfloor(1)=w(\bar{i}),\left\lfloor w r_{\gamma}\right\rfloor(2)=w(\overline{i-1}),\left\lfloor w r_{\gamma}\right\rfloor(u)=w(u-2)$ for $u \in[3, i]$, $\gamma^{\vee}=\varepsilon_{i-1}+\varepsilon_{i}$, and $\ell\left(\left\lfloor w r_{\gamma}\right\rfloor\right)-\ell(w)=2 i-4 n+1+2(w(\bar{i})-1)+2(w(\overline{i-1})-2)$. Hence $w(\bar{i})=1$ and $w(\overline{i-1})=2$. This implies (q-B3).

Lemma 4.33. ( $\mathrm{q}-\mathrm{B} 3$ ) implies $\mathrm{Q}(i, w, \gamma)$.
Proof. Assume that ( $\mathrm{q}-\mathrm{B} 3$ ) is true; note that $c_{i}\left(\gamma^{\vee}\right)=2$. We see from Lemmas 4.5 and 4.24 that $\mathrm{Q}(i, w, \gamma)$ is equivalent to $\ell\left(\left\lfloor w r_{\gamma}\right\rfloor\right)-\ell(w)=2 i-4 n+1$. By the same argument as in Step 2 of the proof of Proposition 4.18 in $\S 4.4$, we have $\ell\left(\left\lfloor w r_{\gamma}\right\rfloor\right)-\ell(w)=$ $2 i-4 n+1+2(w(\bar{i})-1)+2(w(\overline{i-1})-2)$. Since $w(\bar{i})=1$ and $w(\overline{i-1})=2$ by ( $\mathrm{q}-\mathrm{B} 3$ ), we conclude that $\ell\left(\left\lfloor w r_{\gamma}\right\rfloor\right)-\ell(w)=2 i-4 n+1$.

Lemma 4.34. $\mathrm{Q}(n, w, \gamma)$ is equivalent to ( $\mathrm{q}-\mathrm{B} 4$ ).
Proof. By Lemmas 4.4 and 4.23, we may assume that $\gamma^{\vee}=\varepsilon_{n-1}+\varepsilon_{n} \in Q^{\vee, I \backslash\{n\}}$ and $\left\lfloor w r_{\gamma}\right\rfloor=w r_{\gamma}\left(z_{\gamma \vee}^{I \backslash\{n\}}\right)^{-1}$. We see from Lemmas 4.5 and 4.24 that $\mathrm{Q}(n, w, \gamma)$ is equivalent to $\ell\left(\left\lfloor w r_{\gamma}\right\rfloor\right)-\ell(w)=1-2 n$.

We first show that $\mathrm{Q}(n, w, \gamma)$ implies (q-B4). Set $J=I \backslash\{n\}$; note that $J$ is of type $A_{n-1}$. We see that $n-2 \in J_{\mathrm{af}}$ satisfies the condition for $\gamma^{\vee} \in Q^{\vee}$ in Lemma 4.1; note that $J \backslash\{n-2\}=[n-3] \sqcup\{n-1\}$ is of type $A_{n-3} \times A_{1}$. Hence $z_{\gamma^{\vee}}^{J}=$ $w_{0}^{J} w_{0}^{J \backslash\{n-2\}}=w_{0}^{J} w_{0}^{[n-3]} w_{0}^{\{n-1\}}$ is given by $u \mapsto u+2$ for $u \in[n-2], n-1 \mapsto 1$, and $n \mapsto 2$. Then $\left\lfloor w r_{\gamma}\right\rfloor$ is given by $1 \mapsto w(\bar{n}), 2 \mapsto w(\overline{n-1})$, and $u \mapsto w(u-2)$ for $u \in[3, n]$. It follows from Lemma 4.11 that

$$
\begin{equation*}
\underbrace{w(\bar{n}) \prec w(\overline{n-1})}_{\preceq n} \prec w(1) \prec w(2) \prec \cdots \prec w(n-2) \prec \underbrace{w(n-1) \prec w(n)}_{\succeq \bar{n}} . \tag{88}
\end{equation*}
$$

Hence $\|w(\bar{n})\|<\|w(\overline{n-1})\|<\|w(u)\|$ for $u \in[n-2]$, which implies $\left\lfloor w r_{\gamma}\right\rfloor(1)=$ $w(\bar{n})=1$ and $\left\lfloor w r_{\gamma}\right\rfloor(2)=w(\overline{n-1})=2$. This proves (q-B4).

We next show that ( q -B4) implies $\mathrm{Q}(n, w, \gamma$ ). We see that ( $\mathrm{q}-\mathrm{B} 4$ ) yields (88). If we prove that
(1) $\mathrm{a}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=\mathrm{a}_{s}(w)=0$ for $s \in[n], \mathrm{b}_{1}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=\mathrm{b}_{2}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=\mathrm{b}_{n}(w)=0$, $\mathrm{b}_{n-1}(w)=1$,
(2) $\mathrm{e}_{1}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=\mathrm{e}_{2}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=0, \mathrm{e}_{n-1}(w)=\mathrm{e}_{n}(w)=1, \mathrm{e}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=\mathrm{e}_{s-2}(w)$ for $s \in[3, n]$,
(3) $\mathrm{b}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=\mathrm{b}_{s-2}(w)-2$ for $s \in[3, n]$,

## Motohiro IshiI

then $\ell\left(\left\lfloor w r_{\gamma}\right\rfloor\right)-\ell(w)=1-2 n$, which implies $\mathrm{Q}(n, w, \gamma)$. We prove $(1)-(3)$ as follows. (1)-(2) follows from (88). We deduce from $n-1, n \in \mathrm{~B}_{s-2}(w)$ that the map

$$
\begin{aligned}
\mathrm{B}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right) & =\{t \in[s+1, n] \mid \underbrace{\left\lfloor w r_{\gamma}\right\rfloor(s)}_{=w(s-2)} \succ \underbrace{\sigma\left(\left\lfloor w r_{\gamma}\right\rfloor(t)\right)}_{=\sigma(w(t-2))}\} \\
& \rightarrow \mathrm{B}_{s-2}(w) \backslash\{n-1, n\}, t \mapsto t-2
\end{aligned}
$$

is bijective, which implies $\mathrm{b}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=\mathrm{b}_{s-2}(w)-2$ for $s \in[3, n]$. This proves (3).
Proof of Proposition 4.21. (1) and (3)-(4) follow by the same method as in the proof of Proposition 4.8.

We prove (2). The assertion for $i=1$ follows immediately from Proposition 4.27. Also, we can prove the assertion for $i=n$ by a similar argument to the proof of Proposition 4.13. Assume that $i \in[2, n-1]$. Let $x, y \in\left(W^{I \backslash\{i\}}\right)_{\mathrm{af}}, \mathcal{Y}_{i}^{B_{n}}(x)=(\mathrm{T}, c)$, and $\mathcal{Y}_{i}^{B_{n}}(y)=\left(\mathrm{T}^{\prime}, c^{\prime}\right)$. It follows immediately from Propositions 4.25-4.27 that $x \preceq y$ implies $c \leqslant c^{\prime}$ and $\mathrm{T}(u) \preceq \mathrm{T}^{\prime}\left(u+c^{\prime}-c\right)$ for $u \in\left[i-c^{\prime}+c\right]$. Hence we may assume that $d:=c^{\prime}-c \geqslant 0$ and $\mathrm{T}(u) \preceq \mathrm{T}^{\prime}(u+d)$ for $u \in[i-d]$. The proof is by induction on $d$. The assertion for $d=0$ follows immediately from Propositions 4.25 and 4.27. Assume that $d \geqslant 1$. In what follows, we write $e=\#\{u \in[i] \mid \mathrm{T}(u) \succeq \bar{n}\}$ and $\left\{a_{1}<a_{2}<\cdots<a_{n-i+e}\right\}=[n] \backslash\{\mathbf{T}(u) \mid u \in[i]\}$. We have $\bar{n} \preceq \mathbf{T}(i-u+1) \preceq \overline{a_{u}}$ for $u \in[e]$. Note that $\mathrm{T}(i-d) \preceq n$ is equivalent to $e \leqslant d$. We have divided the proof into seven steps.

Step 1. We prove that if $d \geqslant 2$ is even, then $x \prec y$. Let $s \in[i+1]$ be such that $\mathrm{T}(s) \succeq s+2$ and $\mathrm{T}(u) \preceq u+1$ for $u \in[s-1]$. Define $\mathrm{T}_{1}, \mathrm{~T}_{2} \in \operatorname{CST}_{B_{n}}\left(\varpi_{i}\right)$ by

$$
\begin{aligned}
& \mathrm{T}_{1}(u)= \begin{cases}u+2 & \text { if } u \in[\min \{s-1, i-2\}], \\
\mathrm{T}(u) & \text { if } u \in[s, i-2], \\
\overline{2} & \text { if } u=i-1, \\
\overline{1} & \text { if } u=i,\end{cases} \\
& \mathrm{T}_{2}(u)= \begin{cases}1 & \text { if } u=1, \\
2 & \text { if } u=2, \\
\mathrm{~T}_{1}(u-2) & \text { if } u \in[3, i] .\end{cases}
\end{aligned}
$$

Let $x_{1}, x_{2} \in\left(W^{I \backslash\{i\}}\right)_{\text {af }}$ be such that $\mathcal{Y}_{i}^{B_{n}}\left(x_{1}\right)=\left(\mathrm{T}_{1}, c\right)$ and $\mathcal{Y}_{i}^{B_{n}}\left(x_{2}\right)=\left(\mathrm{T}_{2}, c+2\right)$. We have $\mathrm{T}(u) \preceq \mathrm{T}_{1}(u)$ for $u \in[i]$. Hence $x \preceq x_{1}$ by the assertion for $d=0$. We have $x_{1} \prec x_{2}$ by Proposition 4.27 ( $\frac{\infty}{2}-\mathrm{B} 7$ ). It remains to prove that $x_{2} \preceq y$. By induction hypothesis, it suffices to show that $\mathrm{T}_{2}(u) \preceq \mathrm{T}^{\prime}(u+d-2)$ for $u \in[i-d+2]$; note that $c^{\prime}-(c+2)=d-2 \geqslant 0$ is even. We have $\mathrm{T}_{2}(1)=1 \preceq \mathrm{~T}^{\prime}(1+d-2)$ and $\mathrm{T}_{2}(2)=2 \preceq \mathrm{~T}^{\prime}(2+d-2)$. Let $u \in[i-d+2] \cap[3, i]$. If $u-2 \in[\min \{s-1, i-2\}]$, then $\mathrm{T}_{2}(u)=u \preceq \mathrm{~T}^{\prime}(u) \prec \mathrm{T}^{\prime}(u+d-2)$. If $u-2 \in[s, i-2]$, then $\mathrm{T}_{2}(u)=\mathrm{T}(u-2) \preceq$ $\mathrm{T}^{\prime}(u+d-2)$.

Step 2. We prove that if $x \prec y, d$ is odd, and $d \in[i-1]$, then $\mathbf{T}(i-d) \preceq n$, or equivalently, $e \leqslant d$. Since $d$ is odd, we see from Proposition 4.27 that there exists an edge $x_{1} \xrightarrow{\beta} x_{2}, x_{1}, x_{2} \in\left(W^{I \backslash\{i\}}\right)_{\text {af }}, \beta \in \Delta_{\mathrm{af}}^{+}$, in $\mathrm{SiB}^{I \backslash\{i\}}$ of type $\left(\frac{\infty}{2}\right.$-B6) such that $x \preceq x_{1}$ and $x_{2} \preceq y$; we may assume that there is no edges of type ( $\frac{\infty}{2}-\mathrm{B} 6$ ) in a directed path $\mathbf{p}$ from $x$ to $x_{1}$ in $\mathrm{SiB}^{I \backslash\{i\}}$. Write $\mathcal{Y}_{i}^{B_{n}}\left(x_{1}\right)=\left(\mathrm{T}_{1}, c_{1}\right)$ and $\mathcal{Y}_{i}^{B_{n}}\left(x_{2}\right)=\left(\mathrm{T}_{2}, c_{2}\right)$; note that $c_{1}-c$ is even. Set $e_{1}=\#\left\{u \in[i] \mid \mathrm{T}_{1}(u) \succeq \bar{n}\right\}$; we have $e_{1}=1$ by ( $\frac{\infty}{2}$-B6). It follows from Proposition 4.27 that there exist $\left(c_{1}-c\right) / 2$ edges of type $\left(\frac{\infty}{2}-\mathrm{B} 7\right)$ in the directed path $\mathbf{p}$, and hence $1=e_{1} \geqslant e-\left(c_{1}-c\right)$. Since $c^{\prime}-c_{2} \geqslant 0$ and $c_{2}-c_{1}=1$, we have $d=c^{\prime}-c=\left(c^{\prime}-c_{2}\right)+\left(c_{2}-c_{1}\right)+\left(c_{1}-c\right) \geqslant 1+\left(c_{1}-c\right) \geqslant e$.

Step 3. We prove that if $x \prec y, d$ is odd, $d \in[i]$, and $\mathbf{T}(i-d+1)=\overline{a_{d}}$, then $1 \prec a_{d} \prec \mathrm{~T}^{\prime}\left(a_{d}\right)$; we see from Step 2 and $\mathrm{T}(i-d+1)=\overline{a_{d}}$ that $e=d$ and $a_{d} \in[d, i]$. We proceed by induction on $d$.

Assume that $d=1$. We first prove that $1 \prec a_{1}$. It follows from $d=1, x \prec y$, and Proposition 4.27 that there exists an edge $x_{1} \xrightarrow{\beta} x_{2}, x_{1}, x_{2} \in\left(W^{I \backslash\{i\}}\right)_{\mathrm{af}}$, $\beta \in \Delta_{\mathrm{af}}^{+}$, in $\mathrm{SiB}^{I \backslash\{i\}}$ of type $\left(\frac{\infty}{2}\right.$-B6) such that $x \preceq x_{1}$ and $x_{2} \preceq y$. If we write $\mathcal{Y}_{i}^{B_{n}}\left(x_{1}\right)=\left(\mathbf{T}^{\prime \prime}, c^{\prime \prime}\right)$, then $c^{\prime \prime}=c, \mathbf{T}(u) \preceq \mathrm{T}^{\prime \prime}(u)$ for $u \in[i]$, and $\mathrm{T}^{\prime \prime}(i) \prec \overline{1}$ (see $\left(\frac{\infty}{2}\right.$-B6 $)$ ). Hence $\overline{a_{1}}=\mathrm{T}(i) \preceq \mathrm{T}^{\prime \prime}(i) \prec \overline{1}$, which gives $1 \prec a_{1}$.

Assume that $d=1$. We next prove that $a_{1} \prec \mathrm{~T}^{\prime}\left(a_{1}\right)$. Suppose, contrary to our claim, that $\mathrm{T}^{\prime}\left(a_{1}\right) \preceq a_{1}$. By a similar argument above, we see from Proposition 4.27 (see $\left.\left(\frac{\infty}{2}-\mathrm{B} 6\right)\right)$ that there exist $l \in\left[2, a_{1}\right]$ and $\mathrm{T}_{1}, \mathrm{~T}_{2} \in \operatorname{CST}_{B_{n}-}\left(\varpi_{i}\right)$ such that $\mathrm{T}(u) \preceq$ $\mathrm{T}_{1}(u)$ for $u \in[i], \mathrm{T}_{1}(u)=u+1$ for $u \in[l-2], \mathrm{T}_{1}(i)=\bar{l}, \mathrm{~T}_{2}(1)=1, \mathrm{~T}_{2}(u)=$ $\mathrm{T}_{1}(u-1)$ for $u \in[2, i]$, and $\mathrm{T}_{2}(u) \preceq \mathrm{T}^{\prime}(u)$ for $u \in[i]$; it follows from Lemma 4.11 that $\mathrm{T}_{1}(u) \succeq u+2$ for $u \in[l-1, i-1]$. Since $a_{1}-1 \in[l-1, i-1]$, we have $\mathrm{T}_{2}\left(a_{1}\right)=\mathrm{T}_{1}\left(a_{1}-1\right) \succeq a_{1}+1 \succ a_{1} \succeq \mathrm{~T}^{\prime}\left(a_{1}\right)$, contrary to $\mathrm{T}_{2}\left(a_{1}\right) \preceq \mathrm{T}^{\prime}\left(a_{1}\right)$.

Assume that $d \geqslant 3$. Since $a_{d} \in[d, i]$, we have $1 \prec a_{d}$. It remains to prove that $a_{d} \prec \mathrm{~T}^{\prime}\left(a_{d}\right)$. Define $\mathrm{T}_{3}, \mathrm{~T}_{4} \in \operatorname{CST}_{B_{n}}\left(\varpi_{i}\right)$ by

$$
\begin{aligned}
& \mathrm{T}_{3}(u)= \begin{cases}u+2 & \text { if } u \in\left[a_{2}-2\right], \\
\mathrm{T}(u) & \text { if } u \in\left[a_{2}-1, i-2\right], \\
\overline{2} & \text { if } u=i-1, \\
\overline{1} & \text { if } u=i,\end{cases} \\
& \mathrm{T}_{4}(u)= \begin{cases}1 & \text { if } u=1, \\
2 & \text { if } u=2, \\
\mathrm{~T}_{3}(u-2) & \text { if } u \in[3, i] ;\end{cases}
\end{aligned}
$$

note that if $u \in[i-2]$ and $\mathrm{T}(u) \succ a_{2}$, then $u \in\left[a_{2}-1, i-2\right]$ and $\mathrm{T}_{3}(u)=\mathrm{T}(u)$. Let $x_{4} \in\left(W^{I \backslash\{i\}}\right)_{\text {af }}$ be such that $\mathcal{Y}_{i}^{B_{n}}\left(x_{4}\right)=\left(\mathrm{T}_{4}, c+2\right)$. We see that $c^{\prime}-(c+2)=d-2$ is odd, $d-2 \in[i-2], \mathrm{T}_{4}(i-(d-2)) \preceq n$ (by Step 2), and $\mathrm{T}_{4}(i-(d-2)+1)=$ $\mathrm{T}_{3}(i-d+1)=\mathrm{T}(i-d+1)=\overline{a_{d}}$; note that $i-d+1 \in[i-2]$ and $[n] \backslash\left\{\mathrm{T}_{4}(u) \mid\right.$ $u \in[i-d+2]\}=\left\{a_{3}<\cdots<a_{n-i+d}\right\}$. Therefore, if we prove that $x_{4} \preceq y$, then $a_{d} \prec \mathrm{~T}^{\prime}\left(a_{d}\right)$ by induction hypothesis.

Let us prove that $x_{4} \preceq y$. It suffices to show that $\mathrm{T}^{\prime \prime} \in \operatorname{CST}_{B_{n}}\left(\varpi_{i}\right)$ and $(\mathrm{T}, c) \prec$ ( $\mathrm{T}^{\prime \prime}, c+2$ ) imply ( $\mathrm{T}_{4}, c+2$ ) $\preceq\left(\mathrm{T}^{\prime \prime}, c+2\right.$ ). Indeed, we see from Proposition 4.27 that there exists $x^{\prime \prime} \in\left(W^{I \backslash\{i\}}\right)_{\text {af }}$ such that $x \prec x^{\prime \prime} \preceq y$ and $\mathcal{Y}_{i}^{B_{n}}\left(x^{\prime \prime}\right)=\left(\mathrm{T}^{\prime \prime}, c+2\right)$ for some $\mathrm{T}^{\prime \prime} \in \operatorname{CST}_{B_{n}}\left(\varpi_{i}\right)$. Since $(c+2)-c=2$ is even, $x \prec x^{\prime \prime}$ is equivalent to $(\mathrm{T}, c) \prec\left(\mathrm{T}^{\prime \prime}, c+2\right)$ by Step 1. Also, $x_{4} \preceq x^{\prime \prime}$ is equivalent to $\left(\mathrm{T}_{4}, c+2\right) \preceq\left(\mathrm{T}^{\prime \prime}, c+2\right)$. Therefore, $\left(\mathrm{T}_{4}, c+2\right) \preceq\left(\mathrm{T}^{\prime \prime}, c+2\right)$ (and $\left.x^{\prime \prime} \preceq y\right)$ yield $x_{4} \preceq y$.

Assume that $\mathrm{T}^{\prime \prime} \in \mathrm{CST}_{B_{n}}\left(\varpi_{i}\right)$ and $(\mathrm{T}, c) \prec\left(\mathrm{T}^{\prime \prime}, c+2\right)$. We have $\mathrm{T}_{4}(u)=u \preceq \mathrm{~T}^{\prime \prime}(u)$ for $u \in\left[a_{2}\right]$, and $\mathrm{T}_{4}(u)=\mathrm{T}(u-2) \preceq \mathrm{T}^{\prime \prime}(u)$ for $u \in\left[a_{2}+1, i\right]$. Hence $\left(\mathrm{T}_{4}, c+2\right) \preceq$ ( $\mathrm{T}^{\prime \prime}, c+2$ ).

Step 4. We prove that $d=1$ and (ii) in Definition 4.20 (2) for ( $\mathrm{T}, c$ ) and ( $\mathrm{T}^{\prime}, c^{\prime}$ ) imply $x \prec y$.

We first assume that $(i \neq n-1$ and $\mathbf{T}(i) \preceq n)$ or $\left(\bar{n} \preceq \mathbf{\top}(i) \prec \overline{a_{1}}\right)$. Then $n-i+e \geqslant 2$ and $\mathrm{T}(i) \preceq \overline{a_{2}}$. Define $\mathrm{T}_{1}, \mathrm{~T}_{2} \in \mathrm{CST}_{B_{n}}\left(\varpi_{i}\right)$ by

$$
\begin{aligned}
& \mathrm{T}_{1}(u)= \begin{cases}u+1 & \text { if } u \in\left[a_{2}-2\right], \\
\mathrm{T}(u) & \text { if } u \in\left[a_{2}-1, i-1\right], \\
\overline{a_{2}} & \text { if } u=i,\end{cases} \\
& \mathrm{T}_{2}(u)= \begin{cases}1 & \text { if } u=1, \\
\mathrm{~T}_{1}(u-1) & \text { if } u \in[2, i] .\end{cases}
\end{aligned}
$$

Let $x_{1}, x_{2} \in\left(W^{I \backslash\{i\}}\right)_{\text {af }}$ be such that $\mathcal{Y}_{i}^{B_{n}}\left(x_{1}\right)=\left(\mathrm{T}_{1}, c\right)$ and $\mathcal{Y}_{i}^{B_{n}}\left(x_{2}\right)=\left(\mathrm{T}_{2}, c^{\prime}\right)=$ $\left(\mathrm{T}_{2}, c+1\right)$. We have $\mathrm{T}(u)=u \prec u+1=\mathrm{T}_{1}(u)$ for $u \in\left[a_{1}-1\right]$, $\mathrm{T}(u)=\mathrm{T}_{1}(u)$ for $u \in\left[a_{1}, i-1\right]$, and $\mathrm{T}(i) \preceq \overline{a_{2}}=\mathrm{T}_{1}(i)$. Hence $x \preceq x_{1}$ by the assertion for $d=0$. We have $x_{1} \preceq x_{2}$ by Proposition $4.27\left(\frac{\infty}{2}\right.$-B6). We have $\mathrm{T}_{2}(u)=u \preceq \mathrm{~T}^{\prime}(u)$ for $u \in\left[a_{2}-1\right]$, and $\mathrm{T}_{2}(u)=\mathrm{T}(u-1) \preceq \mathrm{T}^{\prime}(u)$ for $u \in\left[a_{2}, i\right]$. Hence $x_{2} \preceq y$ by the assertion for $d=0$. Consequently, we have $x \prec y$.

We next assume that $i=n-1$ and $\mathrm{T}(n-1) \preceq n$; note that $n-i+e=1$. Define $\mathrm{T}_{1}, \mathrm{~T}_{2} \in \mathrm{CST}_{B_{n}}\left(\varpi_{n-1}\right)$ to be such that $\mathrm{T}_{1}(u)=\mathrm{T}(u)$ for $u \in[n-2], \mathrm{T}_{1}(n-1)=\overline{a_{1}}$, $\mathrm{T}_{2}(1)=1$, and $\mathrm{T}_{2}(u)=\mathrm{T}_{1}(u-1)$ for $u \in[2, n-1]$. Let $x_{1}, x_{2} \in\left(W^{I \backslash\{i\}}\right)_{\text {af }}$ be such that $\mathcal{Y}_{i}^{B_{n}}\left(x_{1}\right)=\left(\mathrm{T}_{1}, c\right)$ and $\mathcal{Y}_{i}^{B_{n}}\left(x_{2}\right)=\left(\mathrm{T}_{2}, c^{\prime}\right)=\left(\mathrm{T}_{2}, c+1\right)$. By a similar argument above, we can see that $x \preceq x_{1} \prec x_{2} \preceq y$.

We next assume that $\mathrm{T}(i)=\overline{a_{1}}$ and $1 \prec a_{1} \prec \mathrm{~T}^{\prime}\left(a_{1}\right)$. Then $e=d, n-i+e \geqslant 2$, $a_{2} \in[3, i+1]$, and $u+1 \preceq \mathrm{~T}^{\prime}(u)$ for $u \in\left[a_{1}, i\right]$ (see (ii) in Definition 4.20 (2)). Define $\mathrm{T}_{3}, \mathrm{~T}_{4} \in \operatorname{CST}_{B_{n}}\left(\varpi_{i}\right)$ by

$$
\begin{aligned}
& \mathrm{T}_{3}(u)= \begin{cases}u+1 & \text { if } u \in\left[a_{1}-2\right], \\
u+2 & \text { if } u \in\left[a_{1}-1, a_{2}-2\right], \\
\mathrm{T}(u) & \text { if } u \in\left[a_{2}-1, i\right],\end{cases} \\
& \mathrm{T}_{4}(u)= \begin{cases}1 & \text { if } u=1, \\
\mathrm{~T}_{3}(u-1) & \text { if } u \in[2, i] .\end{cases}
\end{aligned}
$$

Let $x_{3}, x_{4} \in\left(W^{I \backslash\{i\}}\right)_{\text {af }}$ be such that $\mathcal{Y}_{i}^{B_{n}}\left(x_{3}\right)=\left(\mathrm{T}_{3}, c\right)$ and $\mathcal{Y}_{i}^{B_{n}}\left(x_{4}\right)=\left(\mathrm{T}_{4}, c^{\prime}\right)=$ $\left(\mathrm{T}_{4}, c+1\right)$. We have $\mathrm{T}(u)=u \prec u+1=\mathrm{T}_{3}(u)$ for $u \in\left[a_{1}-2\right]$, $\mathrm{T}\left(a_{1}-1\right)=$ $a_{1}-1 \prec a_{1}+1=\mathrm{T}_{3}\left(a_{1}-1\right), \mathrm{T}(u)=u+1 \prec u+2=\mathrm{T}_{3}(u)$ for $u \in\left[a_{1}, a_{2}-2\right]$, and $\mathrm{T}(u)=\mathrm{T}_{3}(u)$ for $u \in\left[a_{2}-1, i\right]$. Hence $x \preceq x_{3}$ by the assertion for $d=0$. We have $x_{3} \preceq x_{4}$ by Proposition $4.27\left(\frac{\infty}{2}\right.$-B6). We have $\mathrm{T}_{4}(u)=u \preceq \mathrm{~T}^{\prime}(u)$ for $u \in\left[a_{1}-1\right]$, $\mathrm{T}_{4}(u)=\mathrm{T}_{3}(u-1)=u+1 \preceq \mathrm{~T}^{\prime}(u)$ for $u \in\left[a_{1}, a_{2}-1\right]$, and $\mathrm{T}_{4}(u)=\mathrm{T}(u-1) \preceq \mathrm{T}^{\prime}(u)$ for $u \in\left[a_{2}, i\right]$. Hence $x_{4} \preceq y$ by the assertion for $d=0$. Consequently, we have $x \prec y$.

Step 5. We prove that if $d$ is odd, $d=e \in[3, i], \mathrm{T}(i-d+1)=\overline{a_{d}}$, and $1 \prec a_{d} \prec \mathrm{~T}^{\prime}\left(a_{d}\right)$, then $x \prec y$. Let $\mathrm{T}_{3}, \mathrm{~T}_{4} \in \operatorname{CST}_{B_{n}}\left(\varpi_{i}\right)$ be as in Step 3, and let $x_{3}, x_{4} \in\left(W^{I \backslash\{i\}}\right)_{\text {af }}$ be such that $\mathcal{Y}_{i}^{B_{n}}\left(x_{3}\right)=\left(\mathrm{T}_{3}, c\right)$ and $\mathcal{Y}_{i}^{B_{n}}\left(x_{4}\right)=\left(\mathrm{T}_{4}, c+2\right)$. We have $\mathrm{T}(u) \preceq \mathrm{T}_{3}(u)$ for $u \in[i]$, and hence $x \preceq x_{3}$ by the assertion for $d=0$. We have $x_{3} \prec x_{4}$ by Proposition $4.27\left(\frac{\infty}{2}-\mathrm{B} 7\right)$. Hence $x \prec x_{4}$. By the same method as in Step 3, we see that $c^{\prime}-(c+2)=d-2$ is odd, $d-2 \in[i-2], \mathrm{T}_{4}(i-(d-2)) \preceq n, \mathrm{~T}_{4}(i-(d-2)+1)=\overline{a_{d}}$, and $\left\{a_{3}<\cdots<a_{n-i+d}\right\}=[n] \backslash\left\{\mathrm{T}_{4}(u) \mid u \in[i]\right\}$. Also, we have $\mathrm{T}_{4}(u) \preceq \mathrm{T}^{\prime}(u+d-2)$ for $u \in[i-d+2]$, because $\mathrm{T}_{4}(u)=u \preceq \mathrm{~T}^{\prime}(u) \preceq \mathrm{T}^{\prime}(u+d-2)$ for $u \in\left[\min \left\{a_{2}, i-d+2\right\}\right]$, and $\mathrm{T}_{4}(u)=\mathrm{T}(u-2) \preceq \mathrm{T}^{\prime}(u+d-2)$ for $u \in\left[a_{2}+1, i-d+2\right]$. Consequently, $\left(\mathrm{T}_{4}, c+2\right) \preceq\left(\mathrm{T}^{\prime}, c^{\prime}\right)$ (see (ii) in Definition 4.20 (2)). By induction hypothesis (and Step 4), we have $x_{4} \preceq y$. Hence $x \prec y$.

Step 6 . We prove that if $d$ is odd, $d \in[3, i]$, and $\mathbf{T}(i-d+1) \preceq n$, then $x \prec y$. We proceed by induction on $e$; note that $e \in[0, d-1]$.

Assume that $e=0$. By the same method as in Step 4, we can find $x_{1}, x_{2} \in$ $\left(W^{I \backslash\{i\}}\right)_{\text {af }}$ and $\mathrm{T}_{1}, \mathrm{~T}_{2} \in \mathrm{CST}_{B_{n}}\left(\varpi_{i}\right)$ such that $\mathcal{Y}_{i}^{B_{n}}\left(x_{1}\right)=\left(\mathrm{T}_{1}, c\right), \mathcal{Y}_{i}^{B_{n}}\left(x_{2}\right)=\left(\mathrm{T}_{2}, c+\right.$ $1), x \preceq x_{1} \prec x_{2}$, and $\mathrm{T}_{2}(u) \preceq \mathrm{T}^{\prime}(u+d-1)$ for $u \in[u-d+1]$. Since $c^{\prime}-(c+1)=d-1$ is even, we have $x_{2} \preceq y$ by Step 1 . Hence $x \prec y$.

Assume that $e \in[d-1]$. Let $\mathrm{T}_{4} \in \operatorname{CST}_{B_{n}}\left(\varpi_{i}\right)$ and $x_{4} \in\left(W^{I \backslash\{i\}}\right)_{\text {af }}$ be as in Step 3 ; since $n-i+e \geqslant 2, \mathrm{~T}_{4}$ is well-defined. By the same method as in Step 5 , we see that $x \prec x_{4}, c^{\prime}-(c+2)=d-2$ is odd, and $\mathrm{T}_{4}(u) \preceq \mathrm{T}^{\prime}(u+d-2)$ for $u \in[i-d+2]$. It remains to prove that $x_{4} \preceq y$. We have $\mathrm{T}_{4}(i-d+3) \preceq \max \{i-d+3, \mathrm{\top}(i-d+1)\} \preceq n$ and $\#\left\{u \in[i] \mid \mathrm{T}_{4}(u) \succeq \bar{n}\right\}=\max \{0, e-2\}<e$. If $d \geqslant 5$, then $c^{\prime}-(c+2) \in[3, i]$, and hence $x_{4} \preceq y$ by induction hypothesis. If $d=3$, then $e \in[2], c^{\prime}-(c+2)=1$, $\mathrm{T}_{4}(i) \preceq n$, and hence $x_{4} \preceq y$ by Step 4 . Thus $x \prec y$.

Step 7. We prove that if $d$ is odd and $d>i$, then $x \prec y$. Note that $d \geqslant 3$ and $n-i+e \geqslant 1$.

We first assume that $n-i+e=1$. Then $i=n-1$ and $e=0$. In a way similar to the case of $e=0$ in Step 6 , we can see that $x \prec y$.

We next assume that $n-i+e \geqslant 2$. We proceed by induction on $d$. Let $\mathrm{T}_{4} \in$ $\operatorname{CST}_{B_{n}}\left(\varpi_{i}\right)$ and $x_{4} \in\left(W^{I \backslash\{i\}}\right)_{\text {af }}$ be as in Step 3; since $n-i+e \geqslant 2, \mathrm{~T}_{4}$ is welldefined. By a similar argument to Step 5, we have $x \prec x_{4}$ and $\mathrm{T}_{4}(u) \preceq \mathrm{T}^{\prime}(u+d-2)$ for $u \in[i-d+2]$. Note that $c^{\prime}-(c+2)=d-2$ is odd. If $d=3=i+1$, then $d-2=1$, $\mathrm{T}_{4}(i)=2 \preceq n$, and hence $x_{4} \preceq y$ by Step 4 . If $d \geqslant 5$ and $d \in\{i+1, i+2\}$, then $d-2 \in[3, i], \mathrm{T}_{4}(i-d+3) \preceq \mathrm{T}_{4}(2)=2 \preceq n$, and hence $x_{4} \preceq y$ by Step 6 . If $d>i+2$, then $d-2>i$, and hence $x_{4} \preceq y$ by induction hypothesis. Thus $x \prec y$.

The proof of Proposition 4.21 is complete.
4.6. Type $D_{n}^{(1)}$. Fix an integer $n \geqslant 4$. Set $I=[n]$. We assume that the labeling of the vertices of the Dynkin diagram of type $D_{n}$ is as follows.

Let $\varepsilon_{1}, \varepsilon_{2}, \ldots, \varepsilon_{n}$ be an orthonormal basis of an $n$-dimensional Euclidean space $\mathbb{R}^{n}$. Let $\Delta=\left\{ \pm\left(\varepsilon_{s} \pm \varepsilon_{t}\right) \mid s, t \in[n], s<t\right\}$ be a root system of type $D_{n}$, and let $\Pi=\left\{\alpha_{s}=\varepsilon_{s}-\varepsilon_{s+1} \mid s \in[n-1]\right\} \sqcup\left\{\alpha_{n}=\varepsilon_{n-1}+\varepsilon_{n}\right\}$ be a simple root system of $\Delta$.

Let $W$ be the Weyl group of $\Delta$. Note that $W$ acts faithfully on $\left\{ \pm \varepsilon_{s} \mid s \in[n]\right\} \subset \mathbb{R}^{n}$. Define a partially ordered set $\mathcal{D}_{n}$ by

$$
\begin{equation*}
\mathcal{D}_{n}=\left\{1 \prec 2 \prec \cdots \prec n-1 \prec \frac{n}{n} \prec \overline{n-1} \prec \cdots \prec \overline{2} \prec \overline{1}\right\} . \tag{89}
\end{equation*}
$$

Let $\sigma: \mathcal{D}_{n} \rightarrow \mathcal{D}_{n}$ be the bijection defined by $s \leftrightarrow \bar{s}$ for $s \in[n]$. If we identify $\mathcal{D}_{n}$ with $\left\{ \pm \varepsilon_{s} \mid s \in[n]\right\}$ by $s=\varepsilon_{s}$ and $\bar{s}=-\varepsilon_{s}$ for $s \in[n]$, then $W$ can be described as follows:

$$
\begin{align*}
& W=\left\{w \in \mathfrak{S}\left(\mathcal{D}_{n}\right) \mid\right. w(\sigma(s))=\sigma(w(s)) \text { for } s \in[n], \text { and } \\
&\#\{s \in[n] \mid w(s) \succeq \bar{n}\} \text { is even }\} . \tag{90}
\end{align*}
$$

Note that $r_{ \pm\left(\varepsilon_{s}-\varepsilon_{t}\right)}=(s t)(\bar{s} \bar{t})$ and $r_{ \pm\left(\varepsilon_{s}+\varepsilon_{t}\right)}=(s \bar{t})(\bar{s} t)$ for $s, t \in[n], s<t$.
For $w \in \mathfrak{S}\left(\mathcal{D}_{n}\right)$ and $s \in[n]$, set

$$
\begin{align*}
& \mathrm{A}_{s}(w)=\left\{t \in[s+1, n] \mid w(s) \succ w(t) \text { in } \mathcal{D}_{n}\right\}, \quad \mathrm{a}_{s}(w)=\# \mathrm{~A}_{s}(w)  \tag{91}\\
& \mathrm{B}_{s}(w)=\left\{t \in[s+1, n] \mid w(s) \succ \sigma(w(t)) \text { in } \mathcal{D}_{n}\right\}, \quad \mathrm{b}_{s}(w)=\# \mathrm{~B}_{s}(w)
\end{align*}
$$

note that $\mathrm{a}_{n}(w)=\mathrm{b}_{n}(w)=0$. The length function $\ell: W \rightarrow \mathbb{Z}_{\geqslant 0}$ is given by

$$
\begin{equation*}
\ell(w)=\sum_{s=1}^{n}\left(\mathrm{a}_{s}(w)+\mathrm{b}_{s}(w)\right) \tag{93}
\end{equation*}
$$

for $w \in W$. The longest element of $W$ is given by $u \mapsto \bar{u}, u \in[n]$, if $n$ is even, and $u \mapsto \bar{u}, u \in[n-1]$, if $n$ is odd.

Let $\|\cdot\|: \mathcal{D}_{n} \rightarrow[n]$ be the map defined by $\|s\|=s$ and $\|\bar{s}\|=s$ for $s \in[n]$. We identify a totally ordered $i$-element subset $\mathrm{T}=\{\mathrm{T}(1) \prec \mathrm{T}(2) \prec \cdots \prec \mathrm{T}(i)\} \subset \mathcal{D}_{n}$ with the column-strict tableau of the form (63). For $i \in I \backslash\{n-1\}$ and $w \in W$, let $\mathrm{T}_{w}^{(i)} \subset \mathcal{D}_{n}$ be the totally ordered $i$-element subset such that

$$
\begin{equation*}
\mathrm{T}_{w}^{(i)}=\left\{\mathbf{T}_{w}^{(i)}(1) \prec \mathbf{T}_{w}^{(i)}(2) \prec \cdots \prec \mathbf{T}_{w}^{(i)}(i)\right\}=\{w(1), w(2), \ldots, w(i)\} \tag{94}
\end{equation*}
$$

For $w \in W$, let $\mathrm{T}_{w}^{(n-1)} \subset \mathcal{D}_{n}$ be the totally ordered $n$-element subset such that

$$
\begin{align*}
\mathbf{T}_{w}^{(n-1)} & =\left\{\mathbf{T}_{w}^{(n-1)}(1) \prec \mathbf{T}_{w}^{(n-1)}(2) \prec \cdots \prec \mathbf{T}_{w}^{(n-1)}(n)\right\}  \tag{95}\\
& =\{w(1), w(2), \ldots, w(n-1), w(\bar{n})\} .
\end{align*}
$$

For $i \in[n-2]$, let $\operatorname{CST}_{D_{n}}\left(\varpi_{i}\right)$ be the family of totally ordered $i$-element subsets T of $\mathcal{D}_{n}$ such that $\|\mathrm{T}(u)\|, u \in[i]$, are all distinct. Let $\mathrm{CST}_{D_{n}}\left(\varpi_{n-1}\right)\left(\right.$ resp. $\left.\mathrm{CST}_{D_{n}}\left(\varpi_{n}\right)\right)$ be the family of totally ordered $n$-element subsets T of $\mathcal{D}_{n}$ such that $\|\mathrm{T}(u)\|, u \in[n]$, are all distinct, and $\#\{u \in[n] \mid \mathrm{T}(u) \succeq \bar{n}\}$ is odd (resp. even). The proof of the next lemma is standard (cf. [4, §8.1]).
Lemma 4.35. Let $i \in I$. We have

$$
\begin{aligned}
& W^{I \backslash\{i\}}= \\
& \left\{\begin{array}{l}
\{w \in W \mid w(1) \prec \cdots \prec w(i), \text { and } \\
w(i+1) \prec \cdots \prec w(n-1) \prec w(n) \prec w(\overline{n-1})\} \text { if } i \in[n-2], \\
\{w \in W \mid w(1) \prec \cdots \prec w(n-1) \prec w(\bar{n})\} \text { if } i=n-1, \\
\{w \in W \mid w(1) \prec \cdots \prec w(n-1) \prec w(n)\} \text { if } i=n .
\end{array}\right.
\end{aligned}
$$

If $w \in W^{I \backslash\{i\}}$, then $\ell(w)=\sum_{s=1}^{i}\left(\mathrm{a}_{s}(w)+\mathrm{b}_{s}(w)\right)$ and $\mathrm{A}_{s}(w) \subset[i+1, n]$ for $s \in[i]$. The map $W^{I \backslash\{i\}} \rightarrow \operatorname{CST}_{D_{n}}\left(\varpi_{i}\right), w \mapsto \mathrm{~T}_{w}^{(i)}$, is bijective.

We see from Lemmas 4.1-4.2 and 4.35 that the map

$$
\begin{equation*}
\mathcal{Y}_{i}^{D_{n}}: W_{\mathrm{af}} \rightarrow \mathrm{CST}_{D_{n}}\left(\varpi_{i}\right) \times \mathbb{Z}, w t_{\xi} \mapsto\left(\mathrm{T}_{w}^{(i)}, c_{i}(\xi)\right) \tag{96}
\end{equation*}
$$

induces a bijection from the subset $\left(W^{I \backslash\{i\}}\right)_{\text {af }} \subset W_{\text {af }}$ to $\operatorname{CST}_{D_{n}}\left(\varpi_{i}\right) \times \mathbb{Z}$.
Definition 4.36. Let $i \in I$, $(\mathrm{T}, c),\left(\mathrm{T}^{\prime}, c^{\prime}\right) \in \mathrm{CST}_{D_{n}}\left(\varpi_{i}\right) \times \mathbb{Z}$, and $d:=c^{\prime}-c$. Define a partial order $\preceq$ on $\operatorname{CST}_{D_{n}}\left(\varpi_{i}\right) \times \mathbb{Z}$ as follows.
(1) Assume that $i \in[n-2]$. $\operatorname{Set}(\mathbf{T}, c) \preceq\left(\mathbf{T}^{\prime}, c^{\prime}\right)$ if

$$
\begin{equation*}
(d \geqslant 0), \quad\left(\mathrm{T}(u) \preceq \mathrm{T}^{\prime}(u+d) \text { in } \mathcal{D}_{n} \text { for } u \in[i-d]\right) \tag{97}
\end{equation*}
$$

and one of the following conditions holds:
(i) $d$ is even.
(ii) $d$ is odd and $\mathrm{T}(i) \preceq n$.
(iii) $d$ is odd and $\mathrm{T}(i) \succeq \bar{n}$. Let

$$
\begin{align*}
a & =\min ([n] \backslash\{\|\mathbf{T}(u)\| \mid u \in[i], \mathbf{T}(u) \succeq \bar{n}\}), \\
b & =\min ([n] \backslash\{\|\mathbf{T}(u)\| \mid u \in[i]\}) \tag{98}
\end{align*}
$$

note that $a \leqslant b$. If $d \in[i]$, then $a \preceq \mathrm{~T}^{\prime}(d)$. If $a<b$ and $k \in[i]$ satisfies $\mathrm{T}(k) \prec b \prec \mathrm{~T}(k+1)$, then $\left(\mathrm{T}(u) \preceq \mathrm{T}^{\prime}(u+d-1)\right.$ for $u \in[2, \min \{k, i-$ $d+1\}]$ ) and ( $b \preceq \mathrm{~T}^{\prime}(k+d)$ if $k \in[i-d]$ ).
(2) Assume that $i \in\{n-1, n\}$. $\operatorname{Set}(\mathrm{T}, c) \preceq\left(\mathrm{T}^{\prime}, c^{\prime}\right)$ if

$$
\begin{equation*}
(d \geqslant 0) \text { and }\left(\mathrm{T}(u) \preceq \mathrm{T}^{\prime}(u+2 d) \text { in } \mathcal{D}_{n} \text { for } u \in[n-2 d]\right) . \tag{99}
\end{equation*}
$$

Proposition 4.37. Let $i \in I$.
(1) $\mathcal{Y}_{i}^{D_{n}} \circ \Pi^{I \backslash\{i\}}=\mathcal{Y}_{i}^{D_{n}}$.
(2) For $x, y \in W_{\text {af }}$, we have $\Pi^{I \backslash\{i\}}(x) \preceq \Pi^{I \backslash\{i\}}(y)$ in $\left(W^{I \backslash\{i\}}\right)_{\text {af }}$ if and only if $\mathcal{Y}_{i}^{D_{n}}(x) \preceq \mathcal{Y}_{i}^{D_{n}}(y)$ in $\operatorname{CST}_{D_{n}}\left(\varpi_{i}\right) \times \mathbb{Z}$.
(3) Let $i \in[n-2]$ and $(\mathrm{T}, c),\left(\mathrm{T}^{\prime}, c^{\prime}\right) \in \operatorname{CST}_{D_{n}}\left(\varpi_{i}\right) \times \mathbb{Z}$. If $c^{\prime}-c>i$, then $(\mathrm{T}, c) \preceq\left(\mathrm{T}^{\prime}, c^{\prime}\right)$.
(4) Let $i \in\{n-1, n\}$ and $(\mathrm{T}, c),\left(\mathrm{T}^{\prime}, c^{\prime}\right) \in \mathrm{CST}_{D_{n}}\left(\varpi_{i}\right) \times \mathbb{Z}$. If $2\left(c^{\prime}-c\right)>n$, then $(\mathrm{T}, c) \preceq\left(\mathrm{T}^{\prime}, c^{\prime}\right)$.

By combining Propositions 3.2 and 4.37 (2), we obtain the following tableau criterion for the semi-infinite Bruhat order on $W_{\text {af }}$ of type $D_{n}^{(1)}$.

Theorem 4.38. Let $J \subset I$. For $x, y \in\left(W^{J}\right)_{\text {af }}$, we have $x \preceq y$ in $\left(W^{J}\right)_{\text {af }}$ if and only if $\mathcal{Y}_{i}^{D_{n}}(x) \preceq \mathcal{Y}_{i}^{D_{n}}(y)$ in $\operatorname{CST}_{D_{n}}\left(\varpi_{i}\right) \times \mathbb{Z}$ for all $i \in I \backslash J$.

The remainder of this subsection is devoted to the proof of Proposition 4.37.
The proofs of Lemmas 4.39-4.40 below are straightforward.
Lemma 4.39. Let $i \in I$ and $\gamma \in \Delta^{+} \backslash \Delta_{I \backslash\{i\}}^{+}$. We have $\gamma^{\vee} \in Q^{\vee, I \backslash\{i\}}$ if and only if one of the following conditions holds:
(1) $i=1$ and $\gamma^{\vee}=\varepsilon_{1}-\varepsilon_{2}=\alpha_{1}^{\vee}$.
(2) $i \in[2, n-2]$ and $\gamma^{\vee}=\varepsilon_{i}-\varepsilon_{i+1}=\alpha_{i}^{\vee}$.
(3) $i \in[2, n-2]$ and $\gamma^{\vee}=\varepsilon_{i-1}+\varepsilon_{i}=\alpha_{i-1}^{\vee}+2 \alpha_{i}^{\vee}+2 \alpha_{i+1}^{\vee}+\cdots+2 \alpha_{n-2}^{\vee}+\alpha_{n-1}^{\vee}+\alpha_{n}^{\vee}$.
(4) $i=n-1$ and $\gamma^{\vee}=\varepsilon_{n-1}-\varepsilon_{n}=\alpha_{n-1}^{\vee}$.
(5) $i=n$ and $\gamma^{\vee}=\varepsilon_{n-1}+\varepsilon_{n}=\alpha_{n}^{\vee}$.

Lemma 4.40. Let $i \in I$. We have

$$
2\left\langle\alpha_{i}^{\vee}, \rho-\rho_{I \backslash\{i\}}\right\rangle= \begin{cases}2 n-i-1 & \text { if } i \in[2, n-2]  \tag{100}\\ 2 n-2 & \text { if } i \in\{1, n-1, n\} .\end{cases}
$$

Proposition 4.41 (cf. [4, §8.2]). Let $i \in I, w \in W^{I \backslash\{i\}}$, and $\gamma \in \Delta^{+}$. There exists a Bruhat edge $w \rightarrow\left\lfloor w r_{\gamma}\right\rfloor=w r_{\gamma}$ in $\mathrm{QB}^{I \backslash\{i\}}$ if and only if $\gamma \in \Delta^{+} \backslash \Delta_{I \backslash\{i\}}^{+}$and one of the following statements holds.
(b-D1) $i \in[n-2], c_{i}\left(\gamma^{\vee}\right)=1$, and there exists $s \in[i]$ such that $w r_{\gamma}(u)=w(u)$ for $u \in[i] \backslash\{s\}, 1 \preceq w(s) \prec n$, and $w r_{\gamma}(s)=\min ([w(s)+1, n] \backslash\{\|w(u)\| \mid u \in$ $[i], w(u) \succeq \bar{n}\})$; in this case, we have $\gamma^{\vee}=\varepsilon_{s}-\varepsilon_{t}=\alpha_{s}^{\vee}+\alpha_{s+1}^{\vee}+\cdots+\alpha_{t}^{\vee}$ for some $t \in[i+1, n]$.
(b-D2) $i \in[n-2], c_{i}\left(\gamma^{\vee}\right)=1$, and there exists $s \in[i]$ such that $w r_{\gamma}(u)=w(u)$ for $u \in[i] \backslash\{s\}, \bar{n} \prec w(s) \preceq \overline{1}$, and $w r_{\gamma}(s)=\sigma(\max ([\|w(s)\|-1] \backslash\{w(u) \mid u \in$ $[i], w(u) \preceq n\})$ ); in this case, we have $\gamma^{\vee}=\varepsilon_{s}-\varepsilon_{t}=\alpha_{s}^{\vee}+\alpha_{s+1}^{\vee}+\cdots+\alpha_{t}^{\vee}$ for some $t \in[i+1, n]$.
(b-D3) $i \in[n-2], c_{i}\left(\gamma^{\vee}\right)=1$, and there exists $s \in[i]$ such that $w r_{\gamma}(u)=w(u)$ for $u \in[i] \backslash\{s\}$, and $\left(w(s), w r_{\gamma}(s)\right) \in\{(n-1, \bar{n}),(n, \overline{n-1})\}$; in this case, we have $\gamma^{\vee}=\varepsilon_{s}+\varepsilon_{t}=\alpha_{s}^{\vee}+\cdots+\alpha_{t-1}^{\vee}+2 \alpha_{t}^{\vee} \cdots+2 \alpha_{n-2}^{\vee}+\alpha_{n-1}^{\vee}+\alpha_{n}^{\vee}$ for some $t \in[i+1, n-1]$, or $\gamma^{\vee}=\varepsilon_{s}+\varepsilon_{n}=\alpha_{s}^{\vee}+\cdots+\alpha_{n-2}^{\vee}+\alpha_{n}^{\vee}$.
(b-D4) $i \in[2, n-2], c_{i}\left(\gamma^{\vee}\right)=2$, and there exist $s, t \in[i]$ such that $s<t$, wr $r_{\gamma}(u)=$ $w(u)$ for $u \in[i] \backslash\{s, t\}$ and either $\left(w r_{\gamma}(s)=w(s)+1=\sigma(w(t))=\sigma\left(w r_{\gamma}(t)\right)+\right.$ $1 \preceq n)$ or $\left(w(s)=\sigma\left(w r_{\gamma}(t)\right)=n-1\right.$ and $\left.w(t)=\sigma\left(w r_{\gamma}(s)\right)=n\right)$ holds; in this case, we have $\gamma^{\vee}=\varepsilon_{s}+\varepsilon_{t}=\alpha_{s}^{\vee}+\cdots+\alpha_{t-1}^{\vee}+2 \alpha_{t}^{\vee}+\cdots+2 \alpha_{n-2}^{\vee}+\alpha_{n-1}^{\vee}+\alpha_{n}^{\vee}$.
(b-D5) $i \in\{n-1, n\}, c_{i}\left(\gamma^{\vee}\right)=1$, and there exist $s, t \in[i]$ such that $s<t$, wr $r_{\gamma}(u)=$ $w(u)$ for $u \in[i] \backslash\{s, t\}$ and $w r_{\gamma}(s)=w(s)+1=\sigma(w(t))=\sigma\left(w r_{\gamma}(t)\right)+1 \preceq n$; in this case, we have $\gamma^{\vee}=\varepsilon_{s}+\varepsilon_{t}=\alpha_{s}^{\vee}+\cdots+\alpha_{t-1}^{\vee}+2 \alpha_{t}^{\vee}+\cdots+2 \alpha_{n-2}^{\vee}+$ $\alpha_{n-1}^{\vee}+\alpha_{n}^{\vee}$.
(b-D6) $i=n-1, c_{n-1}\left(\gamma^{\vee}\right)=1$, and there exists $s \in[n-2]$ such that $w r_{\gamma}(u)=w(u)$ for $u \in[n] \backslash\{s, s+1\}$ and $\sigma\left(w r_{\gamma}(s)\right)=\sigma\left(w r_{\gamma}(s+1)\right)+1=w(s+1)=$ $w(s)+1 \preceq n$; in this case, we have $\gamma^{\vee}=\varepsilon_{s}+\varepsilon_{s+1}=\alpha_{s}^{\vee}+2 \alpha_{s+1}^{\vee}+\cdots+$ $2 \alpha_{n-2}^{\vee}+\alpha_{n-1}^{\vee}+\alpha_{n}^{\vee}$ if $s \in[n-3]$, and $\gamma^{\vee}=\varepsilon_{n-2}+\varepsilon_{n-1}=\alpha_{n-2}^{\vee}+\alpha_{n-1}^{\vee}+\alpha_{n}^{\vee}$ if $s=n-2$.
(b-D7) $i=n, c_{n}\left(\gamma^{\vee}\right)=1$, and there exists $s \in[n-1]$ such that $w r_{\gamma}(u)=w(u)$ for $u \in[n] \backslash\{s, s+1\}$ and $\sigma\left(w r_{\gamma}(s)\right)=\sigma\left(w r_{\gamma}(s+1)\right)+1=w(s+1)=w(s)+1 \preceq n ;$ in this case, we have $\gamma^{\vee}=\varepsilon_{s}+\varepsilon_{s+1}=\alpha_{s}^{\vee}+2 \alpha_{s+1}^{\vee}+\cdots+2 \alpha_{n-2}^{\vee}+\alpha_{n-1}^{\vee}+\alpha_{n}^{\vee}$ if $s \in[n-3], \gamma^{\vee}=\varepsilon_{n-2}+\varepsilon_{n-1}=\alpha_{n-2}^{\vee}+\alpha_{n-1}^{\vee}+\alpha_{n}^{\vee}$ if $s=n-2$, and $\gamma^{\vee}=\varepsilon_{n-1}+\varepsilon_{n}=\alpha_{n}^{\vee}$ if $s=n-1$.
Moreover, for $i \in I \backslash\{n-1\}$ and $w, v \in W^{I \backslash\{i\}}$, we have $w \preceq v$ if and only if $w(u) \preceq v(u)$ in $\mathcal{D}_{n}$ for $u \in[i]$. For $w, v \in W^{I \backslash\{n-1\}}$, we have $w \preceq v$ if and only if $w(\bar{n}) \preceq v(\bar{n})$ in $\mathcal{D}_{n}$ and $w(u) \preceq v(u)$ in $\mathcal{D}_{n}$ for $u \in[n-1]$.

For $i \in I, w \in W^{I \backslash\{i\}}$ and $\gamma \in \Delta^{+} \backslash \Delta_{I \backslash\{i\}}^{+}$, let $\mathrm{Q}(i, w, \gamma)$ denote the following statement.
$\mathrm{Q}(i, w, \gamma)$ : There exists a quantum edge $w \xrightarrow{\gamma}\left\lfloor w r_{\gamma}\right\rfloor$ in $\mathrm{QB}^{I \backslash\{i\}}$.
Proposition 4.42. Let $i \in I, w \in W^{I \backslash\{i\}}$, and $\gamma \in \Delta^{+} \backslash \Delta_{I \backslash\{i\}}^{+}$. Then $\mathrm{Q}(i, w, \gamma)$ is true if and only if one of the following statements holds.
( $\mathrm{q}-\mathrm{D} 1$ ) $i \in[n-2]$ and $c_{i}\left(\gamma^{\vee}\right)=1$. If we write $\left\{a_{1}<a_{2}<\cdots<a_{n-i+1}\right\}=[n] \backslash$ $\{\|w(u)\| \mid u \in[i-1]\}$, then $a_{1}=1,\left\{w(\bar{i}),\left\lfloor w r_{\gamma}\right\rfloor(1)\right\}=\left\{1, a_{2}\right\}$ and $\left\lfloor w r_{\gamma}\right\rfloor(u)=$ $w(u-1)$ for $u \in[2, i]$; in this case, we have $\gamma^{\vee}=\varepsilon_{i}-\varepsilon_{i+1}=\alpha_{i}^{\vee}$.
$(\mathrm{q}-\mathrm{D} 2) \quad i \in[2, n-2], c_{i}\left(\gamma^{\vee}\right)=2,\left\lfloor w r_{\gamma}\right\rfloor(1)=w(\bar{i})=1,\left\lfloor w r_{\gamma}\right\rfloor(2)=w(\overline{i-1})=2$, and $\left\lfloor w r_{\gamma}\right\rfloor(u)=w(u-2)$ for $u \in[3, i]$; in this case, we have $\gamma^{\vee}=\varepsilon_{i-1}+\varepsilon_{i}=$ $\alpha_{i-1}^{\vee}+2 \alpha_{i}^{\vee}+2 \alpha_{i+1}^{\vee}+\cdots+2 \alpha_{n-2}^{\vee}+\alpha_{n-1}^{\vee}+\alpha_{n}^{\vee}$.
$(\mathrm{q}-\mathrm{D} 3) \quad i=n-1, c_{n-1}\left(\gamma^{\vee}\right)=1,\left\lfloor w r_{\gamma}\right\rfloor(1)=w(n)=1,\left\lfloor w r_{\gamma}\right\rfloor(2)=\sigma(w(n-1))=2$, $\left\lfloor w r_{\gamma}\right\rfloor(u)=w(u-2)$ for $u \in[3, n-1]$, and $\left\lfloor w r_{\gamma}\right\rfloor(n)=\sigma(w(n-2))$; in this case, we have $\gamma^{\vee}=\varepsilon_{n-1}-\varepsilon_{n}=\alpha_{n-1}^{\vee}$.
$(\mathrm{q}-\mathrm{D} 4) i=n, c_{n}\left(\gamma^{\vee}\right)=1,\left\lfloor w r_{\gamma}\right\rfloor(1)=\sigma(w(n))=1,\left\lfloor w r_{\gamma}\right\rfloor(2)=\sigma(w(n-1))=2$, and $\left\lfloor w r_{\gamma}\right\rfloor(u)=w(u-2)$ for $u \in[3, n]$; in this case, we have $\gamma^{\vee}=\varepsilon_{n-1}+\varepsilon_{n}=\alpha_{n}^{\vee}$.

Before starting the proof of Proposition 4.42, we mention a consequence of Lemma 4.3 and Propositions 4.41-4.42.

Proposition 4.43. Let $i \in I, x, y \in\left(W^{I \backslash\{i\}}\right)_{\mathrm{af}}, \mathcal{Y}_{i}^{D_{n}}(x)=(\mathrm{T}, c)$, and $\mathcal{Y}_{i}^{D_{n}}(y)=$ $\left(\mathrm{T}^{\prime}, c^{\prime}\right)$. There exists an edge $x \xrightarrow{\beta} y$ in $\mathrm{SiB}^{I \backslash\{i\}}$ for some $\beta \in \Delta_{\mathrm{af}}^{+}$if and only if one of the following conditions holds:
$\left(\frac{\infty}{2}-\mathrm{D} 1\right) i \in[n-2], c^{\prime}=c$, and there exists $s \in[i]$ such that $\mathrm{T}^{\prime}(u)=\mathrm{T}(u)$ for $u \in[i] \backslash\{s\}, 1 \preceq \mathrm{~T}(s) \prec n$, and $\mathrm{T}^{\prime}(s)=\min ([\mathrm{T}(s)+1, n] \backslash\{\|\mathrm{T}(u)\| \mid u \in$ [i], $\mathrm{T}(u) \succeq \bar{n}\})$.
$\left(\frac{\infty}{2}\right.$-D2) $i \in[n-2], c^{\prime}=c$, and there exists $s \in[i]$ such that $\mathrm{T}^{\prime}(u)=\mathrm{T}(u)$ for $u \in[i] \backslash\{s\}, \bar{n} \prec \mathrm{~T}(s) \preceq \overline{1}$, and $\mathrm{T}^{\prime}(s)=\sigma(\max ([\|\mathrm{T}(s)\|-1] \backslash\{\mathrm{T}(u) \mid u \in$ $[i], \mathrm{T}(u) \preceq n\}))$ 。
$\left(\frac{\infty}{2}-\mathrm{D} 3\right) i \in[n-2], c^{\prime}=c$, and there exists $s \in[i]$ such that $\mathrm{T}^{\prime}(u)=\mathrm{T}(u)$ for $u \in[i] \backslash\{s\}$, and $\left(\mathrm{T}(s), \mathrm{T}^{\prime}(s)\right) \in\{(n-1, \bar{n}),(n, \overline{n-1})\}$.
$\left(\frac{\infty}{2}-\mathrm{D} 4\right) i \in[2, n-2], c^{\prime}=c$, and there exist $s, t \in[i]$ such that $s<t, \mathrm{~T}^{\prime}(u)=\mathrm{T}(u)$ for $u \in[i] \backslash\{s, t\}$ and $\mathrm{T}^{\prime}(s)=\mathrm{T}(s)+1=\sigma(\mathrm{T}(t))=\sigma\left(\mathrm{T}^{\prime}(t)\right)+1 \preceq n$.
$\left(\frac{\infty}{2}-\mathrm{D} 5\right) \quad i \in\{n-1, n\}, c^{\prime}=c$, and there exist $s, t \in[i]$ such that $s<t, \mathrm{~T}^{\prime}(u)=\mathrm{T}(u)$ for $u \in[i] \backslash\{s, t\}$ and $\mathrm{T}^{\prime}(s)=\mathrm{T}(s)+1=\sigma(\mathrm{T}(t))=\sigma\left(\mathrm{T}^{\prime}(t)\right)+1 \preceq n$.
$\left(\frac{\infty}{2}-\mathrm{D} 6\right) ~ i=n-1, c^{\prime}=c$, and there exists $s \in[n-2]$ such that $\mathrm{T}^{\prime}(u)=\mathrm{T}(u)$ for $u \in[n] \backslash\{s, s+1\}$ and $\sigma\left(\mathrm{T}^{\prime}(s)\right)=\sigma\left(\mathrm{T}^{\prime}(s+1)\right)+1=\mathrm{T}(s+1)=\mathrm{T}(s)+1 \preceq n$.
$\left(\frac{\infty}{2}-\mathrm{D} 7\right) ~ i=n, c^{\prime}=c$, and there exists $s \in[n-1]$ such that $\mathrm{T}^{\prime}(u)=\mathrm{T}(u)$ for $u \in[n] \backslash\{s, s+1\}$ and $\sigma\left(\mathrm{T}^{\prime}(s)\right)=\sigma\left(\mathrm{T}^{\prime}(s+1)\right)+1=\mathrm{T}(s+1)=\mathrm{T}(s)+1 \preceq n$.
( $\frac{\infty}{2}$-D8) $i \in[n-2]$ and $c^{\prime}=c+1$. If we write $\left\{a_{1}<a_{2}<\cdots<a_{n-i+1}\right\}=[n]$ $\{\|\mathrm{T}(u)\| \mid u \in[i-1]\}$, then $a_{1}=1,\left\{\sigma(\mathrm{~T}(i)), \mathrm{T}^{\prime}(1)\right\}=\left\{1, a_{2}\right\}$ and $\mathrm{T}^{\prime}(u)=$ $\mathrm{T}(u-1)$ for $u \in[2, i]$.
$\left(\frac{\infty}{2}\right.$-D9) $i \in[2, n-2], c^{\prime}=c+2, \mathrm{~T}^{\prime}(1)=\sigma(\mathrm{T}(i))=1, \mathrm{~T}^{\prime}(2)=\sigma(\mathrm{T}(i-1))=2$, and $\mathrm{T}^{\prime}(u)=\mathrm{T}(u-2)$ for $u \in[3, i]$.
$\left(\frac{\infty}{2}-\mathrm{D} 10\right) \quad i \in\{n-1, n\}, c^{\prime}=c+1, \mathrm{~T}^{\prime}(1)=\sigma(\mathrm{T}(n))=1, \mathrm{~T}^{\prime}(2)=\sigma(\mathrm{T}(n-1))=2$, and $\mathrm{T}^{\prime}(u)=\mathrm{T}(u-2)$ for $u \in[3, n]$.

Example 4.44. (1) Let $i=1$. $\left(\frac{\infty}{2}-\mathrm{D} 8\right)$ is equivalent to $c^{\prime}=c+1$ and $\left(\mathrm{T}, \mathrm{T}^{\prime}\right) \in$ $\{(\boxed{1},, 2),(\boxed{\overline{2}}, \boxed{1})\}$.
(2) Let $n=4$ and $i=2$. ( $\frac{\infty}{2}$-D8) is equivalent to the condition that $c^{\prime}=c+1$ and ( $T, T^{\prime}$ ) equals one of the following:

| ( $\overline{3}$ | $\left.\begin{array}{l}1 \\ 2\end{array}\right)$ |  | ) | $),\left(\begin{array}{\|c\|\|c\|}\hline 4 \\ \overline{2} \\ \hline\end{array}, \begin{array}{\|c}4 \\ \hline\end{array}\right)$ |  | ,$\left(\begin{array}{\|l\|l\|}\overline{4} \\ \overline{2} \\ \hline\end{array}, \frac{1}{\overline{4}}\right.$ $)$, |  | $\left(\begin{array}{\|}\overline{3} \\ \overline{2} \\ \hline\end{array}\right.$ |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| (这 $\overline{1}$ |  |  | 4 | , | 4 |  | 3 ) |  |  |  |  |

$\left(\frac{\infty}{2}\right.$-D9) is equivalent to $c^{\prime}=c+2, \mathrm{~T}=\begin{array}{|}\hline \overline{2} \\ \hline \overline{1} \\ \hline\end{array}$ and $\mathrm{T}^{\prime}=\begin{array}{|}\hline 1 \\ \hline 2 \\ \hline\end{array}$
We have divided the proof of Proposition 4.42 into a sequence of lemmas.
Lemma 4.45. $\mathrm{Q}(1, w, \gamma)$ implies ( $\mathrm{q}-\mathrm{D} 1)$.
Proof. Assume that Q $(1, w, \gamma)$ is true. By Lemmas 4.4 and 4.39, we have $\gamma^{\vee}=\varepsilon_{1}-\varepsilon_{2} \in$ $Q^{\vee, I \backslash\{1\}}, r_{\gamma}=(12)(\overline{1} \overline{2})$, and $\left\lfloor w r_{\gamma}\right\rfloor=w r_{\gamma}\left(z_{\gamma^{\vee}}^{I \backslash\{1\}}\right)^{-1}$. Set $J=I \backslash\{1\}$; note that $J$ is of type $D_{n-1}$. We see that $2 \in J_{\text {af }}$ satisfies the condition for $\gamma^{\vee} \in Q^{\vee}$ in Lemma 4.1; note that $J \backslash\{2\}$ is of type $D_{n-2}$. Hence $z_{\gamma^{\vee}}^{I \backslash\{1\}}=w_{0}^{J} w_{0}^{J \backslash\{2\}}$ is given by $2 \mapsto \overline{2}$, $n \mapsto \bar{n}$, and $u \mapsto u$ for $u \in[n] \backslash\{2, n\}$. Then $\left\lfloor w r_{\gamma}\right\rfloor$ is given by $1 \mapsto w(2), 2 \mapsto w(\overline{1})$, $u \mapsto w(u)$ for $u \in[3, n-1]$, and $n \mapsto w(\bar{n})$. It follows from (90) and Lemma 4.35 that

$$
\begin{equation*}
\max \{w(2), w(\overline{1})\} \prec w(3) \prec w(4) \prec \cdots \prec w(n-1) \prec \underbrace{w(\bar{n})}_{=n} \prec w(\overline{n-1}) . \tag{101}
\end{equation*}
$$

Hence $\left\{\left\lfloor w r_{\gamma}\right\rfloor(1)=w(2), w(\overline{1})\right\}=\left\{a_{1}=1, a_{2}=2\right\}$. This implies (q-D1).
Lemma 4.46. $i=1$ and ( $\mathrm{q}-\mathrm{D} 1$ ) imply $\mathrm{Q}(1, w, \gamma)$.
Proof. Assume that (q-D1) and $i=1$; we have $a_{1}=1, a_{2}=2$, and $\left\{w(\bar{i}),\left\lfloor w r_{\gamma}\right\rfloor(1)\right\}=$ $\{1,2\}$. We see from Lemmas 4.5 and $4.39-4.40$ that $\mathrm{Q}(1, w, \gamma)$ is equivalent to $\ell\left(\left\lfloor w r_{\gamma}\right\rfloor\right)-\ell(w)=3-2 n$. We check at once that (q-D1), $i=1$, and Lemma 4.35 yield (101). If $w(1)=\overline{1}$, then $\ell(w)=2 n-2, \ell\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=1$, and hence
$\ell\left(\left\lfloor w r_{\gamma}\right\rfloor\right)-\ell(w)=3-2 n$. If $w(1)=\overline{2}$, then $\ell(w)=2 n-3, \ell\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=0$, and hence $\ell\left(\left\lfloor w r_{\gamma}\right\rfloor\right)-\ell(w)=3-2 n$.

Lemma 4.47. $n \geqslant 5$, $i \in[2, n-3], c_{i}\left(\gamma^{\vee}\right)=1$, and $\mathrm{Q}(i, w, \gamma)$ imply ( $\mathrm{q}-\mathrm{D} 1$ ).
Proof. Assume that $n \geqslant 5, i \in[2, n-3]$, and $c_{i}\left(\gamma^{\vee}\right)=1$, and that $\mathrm{Q}(i, w, \gamma)$ is true. By Lemmas 4.4 and 4.39 , we have $\gamma^{\vee}=\varepsilon_{i}-\varepsilon_{i+1} \in Q^{\vee, I \backslash\{i\}}, r_{\gamma}=(i i+1)(\bar{i} \overline{i+1})$, and $\left\lfloor w r_{\gamma}\right\rfloor=w r_{\gamma}\left(z_{\gamma^{\vee}}^{I \backslash\{i\}}\right)^{-1}$. Let $I \backslash\{i\}=I_{1} \sqcup I_{2}$, where $I_{1}=[i-1]$ is of type $A_{i-1}$ and $I_{2}=[i+1, n]$ is of type $D_{n-i}$. We see that $(i-1, i+1) \in\left(I_{1}\right)_{\mathrm{af}} \times\left(I_{2}\right)_{\mathrm{af}}$ satisfies the condition for $\gamma^{\vee} \in Q^{\vee}$ in Lemma 4.1; note that $I_{1} \backslash\{i-1\}=[i-2]$ is of type $A_{i-2}$ and $I_{2} \backslash\{i+1\}=[i+2, n]$ is of type $D_{n-i-1}$. Hence $z_{\gamma^{\vee}}^{I \backslash\{i\}}=$ $w_{0}^{I_{1}} w_{0}^{I_{I} \backslash\{i-1\}} w_{0}^{I_{2}} w_{0}^{I_{2} \backslash\{i+1\}}=(12 \cdots i)(\overline{1} \overline{2} \cdots \bar{i})(i+1 \overline{i+1})(n \bar{n})$. Then $\left\lfloor w r_{\gamma}\right\rfloor$ is given by $1 \mapsto w(i+1), u \mapsto w(u-1)$ for $u \in[2, i], i+1 \mapsto w(\bar{i}), u \mapsto w(u)$ for $u \in[i+2, n-1]$, and $n \mapsto w(\bar{n})$. It follows from Lemma 4.35 that

$$
\begin{align*}
& w(i+1) \prec w(1) \prec w(2) \prec \cdots \prec w(i-1) \prec w(i), \\
& \max \{w(\bar{i}), w(i+1)\} \prec w(i+2) \prec \cdots \prec \underbrace{w(n-1)}_{\preceq n} \prec w(\bar{n}) \prec w(\overline{n-1}) . \tag{102}
\end{align*}
$$

Let $\left\{a_{1}<a_{2}<\cdots<a_{n-i+1}\right\}=[n] \backslash\{\|w(u)\| \mid u \in[i-1]\}$. By (102), we have $w(i+1)=\min \{w(u) \mid u \in[n]\}$, which implies $a_{1}=1$. Since $[n] \backslash\{\|w(u)\| \mid u \in$ $[i-1]\}=\{w(\bar{i}), w(i+1), w(i+2), \ldots, w(n-1),\|w(n)\|\}$, we have $\left\{w(\bar{i}),\left\lfloor w r_{\gamma}\right\rfloor(1)=\right.$ $w(i+1)\}=\left\{a_{1}=1, a_{2}\right\}$.

Lemma 4.48. $n \geqslant 5, i \in[2, n-3]$, and ( $\mathrm{q}-\mathrm{D} 1$ ) imply $\mathrm{Q}(i, w, \gamma)$.
Proof. Assume that $n \geqslant 5, i \in[2, n-3]$, and (q-D1) hold. We see from Lemmas 4.5 and 4.39-4.40 that $\mathrm{Q}(i, w, \gamma)$ is equivalent to $\ell\left(\left\lfloor w r_{\gamma}\right\rfloor\right)-\ell(w)=2-2 n+i$. We check at once that (q-D1) yields (102). We deduce from (102) that
(1) $\mathrm{a}_{1}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)= \begin{cases}0 & \text { if } w(i+1) \prec w(\bar{i}), \\ 1 & \text { if } w(i+1) \succ w(\bar{i}),\end{cases}$
(2) $\mathrm{b}_{1}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)= \begin{cases}0 & \text { if } w(i+1) \prec w(\bar{i}), \\ w(i+1)-2 & \text { if } w(i+1) \succ w(\bar{i}),\end{cases}$
(3) for $s \in[2, i]$ and $t \in[s+1, i], t \in \mathrm{~A}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)$ and $t-1 \in \mathrm{~A}_{s-1}(w)$,
(4) for $s \in[2, i]$ and $t \in[s+1, i], t \in \mathrm{~B}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)$ if and only if $t-1 \in \mathrm{~B}_{s-1}(w)$,
(5) for $s \in[2, i], i+1 \in \mathrm{~A}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)$ if and only if $i \in \mathrm{~B}_{s-1}(w)$,
(6) for $s \in[2, i], i+1 \in \mathrm{~B}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)$ if and only if $i \in \mathrm{~A}_{s-1}(w)$,
(7) for $s \in[2, i]$ and $t \in[i+2, n-1], t \in \mathrm{~A}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)$ if and only if $t \in \mathrm{~A}_{s-1}(w)$,
(8) for $s \in[2, i]$ and $t \in[i+2, n-1], t \in \mathrm{~B}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)$ if and only if $t \in \mathrm{~B}_{s-1}(w)$,
(9) for $s \in[2, i], n \in \mathrm{~A}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)$ if and only if $n \in \mathrm{~B}_{s-1}(w)$,
(10) for $s \in[2, i], n \in \mathrm{~B}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)$ if and only if $n \in \mathrm{~A}_{s-1}(w)$,
(11) $i+1 \in \mathrm{~A}_{s-1}(w)$ for $s \in[2, i]$,
(12) $i+1 \in \mathrm{~B}_{s-1}(w)$ if and only if $s \in[i-w(i+1)+3, i]$,
(13) $\mathrm{a}_{i}(w)=n-i, \quad \mathrm{~b}_{i}(w)= \begin{cases}n-i-1 & \text { if } w(i+1) \prec w(\bar{i}), \\ n-i & \text { if } w(i+1) \succ w(\bar{i}) .\end{cases}$

Hence $\ell\left(\left\lfloor w r_{\gamma}\right\rfloor\right)-\ell(w)=2-2 n+i$, which is our assertion.
Lemma 4.49. $n \geqslant 5, c_{n-2}\left(\gamma^{\vee}\right)=1$, and $\mathrm{Q}(n-2, w, \gamma)$ imply ( $\mathrm{q}-\mathrm{D} 1$ ).
Proof. Assume that $n \geqslant 5$ and $c_{n-2}\left(\gamma^{\vee}\right)=1$, and that $\mathrm{Q}(n-2, w, \gamma)$ is true. By Lemmas 4.5 and 4.39-4.40, we have $\ell\left(\left\lfloor w r_{\gamma}\right\rfloor\right)-\ell(w)=-n$. By Lemmas 4.4 and 4.39, we have $\gamma^{\vee}=\varepsilon_{n-2}-\varepsilon_{n-1} \in Q^{\vee, I \backslash\{n-2\}}, r_{\gamma}=(n-2 n-1)(\overline{n-2} \overline{n-1})$, and
$\left\lfloor w r_{\gamma}\right\rfloor=w r_{\gamma}\left(z_{\gamma^{\vee}}^{I \backslash\{n-2\}}\right)^{-1}$. Let $I \backslash\{n-2\}=I_{1} \sqcup I_{2}^{\prime} \sqcup I_{2}^{\prime \prime}$, where $I_{1}=[n-3]$ is of type $A_{n-3}, I_{2}^{\prime}=\{n-1\}$ is of type $A_{1}$, and $I_{2}^{\prime \prime}=\{n\}$ is of type $A_{1}$. We see that $(n-3, n-1, n) \in\left(I_{1}\right)_{\mathrm{af}} \times\left(I_{2}^{\prime}\right)_{\text {af }} \times\left(I_{2}^{\prime \prime}\right)_{\text {af }}$ satisfies the condition for $\gamma^{\vee} \in Q^{\vee}$ in Lemma 4.1; note that $I_{1} \backslash\{n-3\}$ is of type $A_{n-4}$. Hence $z_{\gamma^{\vee}}^{I \backslash\{n-2\}}=w_{0}^{I_{1}} w_{0}^{I_{1} \backslash\{n-3\}} w_{0}^{I_{2}^{\prime}} w_{0}^{I_{2}^{\prime \prime}}=$ $(12 \cdots n-2)(\overline{1} \overline{2} \cdots \overline{n-2})(n-1 \overline{n-1})(n \bar{n})$. Then $\left\lfloor w r_{\gamma}\right\rfloor$ is given by $1 \mapsto w(n-1)$, $u \mapsto w(u-1)$ for $u \in[2, n-2], n-1 \mapsto w(\overline{n-2})$, and $n \mapsto w(\bar{n})$. It follows from Lemma 4.35 that

$$
\begin{align*}
& w(n-1) \prec w(1) \prec w(2) \prec \cdots \prec w(n-3) \prec w(n-2), \\
& \max \{w(\overline{n-2}), w(n-1)\} \prec w(\bar{n}) \prec w(\overline{n-1}) . \tag{103}
\end{align*}
$$

Let $\left\{a_{1}<a_{2}<a_{3}\right\}=[n] \backslash\{\|w(u)\| \mid u \in[n-3]\}=\{\|w(\overline{n-2})\|, w(n-1),\|w(\bar{n})\|\}$. We see from (103) that $a_{1}=1$ and $w(n-1)<\|w(\bar{n})\|$. What is left is to show that $w(\overline{n-2}) \preceq n$ and $\|w(\overline{n-2})\|<\|w(\bar{n})\|$. We have the following cases:
(i) $w(\overline{n-2}) \prec w(n-1)$,
(ii) $w(\overline{n-2}) \succ w(n-1)$ and $w(n-2) \succ w(\bar{n})$,
(iii) $w(\overline{n-2}) \succ w(n-1)$ and $w(n-2) \prec w(\bar{n})$;
we will prove that (i) or (ii) holds and these imply (q-D1). It follows from (103) that
(1) $\mathrm{a}_{1}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)= \begin{cases}1 & \text { if (i), } \\ 0 & \text { if (ii) or (iii), }\end{cases}$
(2) $\mathrm{b}_{1}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)= \begin{cases}w(n-1)-2 & \text { if (i), } \\ 0 & \text { if (ii) or (iii), }\end{cases}$
(3) for $s \in[2, n-2], n-1 \in \mathrm{~A}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)$ if and only if $n-2 \in \mathrm{~B}_{s-1}(w)$,
(4) for $s \in[2, n-2], n \in \mathrm{~A}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)$ if and only if $n \in \mathrm{~B}_{s-1}(w)$,
(5) for $s \in[2, n-2], n-1 \notin \mathrm{~B}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)$ and $n-1 \in \mathrm{~A}_{s-1}(w)$,
(6) for $s \in[2, n-2], n \in \mathrm{~B}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)$ if and only if $n \in \mathrm{~A}_{s-1}(w)$,
(7) for $s \in[2, n-2]$ and $t \in[s+1, n-2], t \in \mathrm{~B}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)$ if and only if $t-1 \in$ $\mathrm{B}_{s-1}(w)$,
(8) for $s \in[2, n-2], n-1 \in \mathrm{~B}_{s-1}(w)$ if and only if $s \in[n-(w(n-1)-1), n-2]$,
(9) $\mathrm{a}_{n-2}(w)=2$ and $\mathrm{b}_{n-2}(w)= \begin{cases}2 & \text { if (i), } \\ 1 & \text { if (ii), } \\ 0 & \text { if (iii). }\end{cases}$

If (i) holds, then $w(n-2)=\overline{1}$. Hence $w(\overline{n-2}) \preceq n$ and $\|w(\overline{n-2})\|<\|w(\bar{n})\|$.
If (ii) holds, then $\left\lfloor w r_{\gamma}\right\rfloor(1)=w(n-1)=1$ and $w(\overline{n-2}) \prec \min \{w(n), w(\bar{n})\} \preceq n$. Hence $\|w(\overline{n-2})\|<\|w(\bar{n})\|$.

If (iii) holds, then $\ell\left(\left\lfloor w r_{\gamma}\right\rfloor\right)-\ell(w)=1-n \neq-n$, a contradiction.
Lemma 4.50. $n \geqslant 5, i=n-2$, and ( $\mathrm{q}-\mathrm{D} 1$ ) imply $\mathrm{Q}(n-2, w, \gamma)$.
Proof. Assume that $n \geqslant 5, i=n-2$, and (q-D1) hold. By Lemmas 4.5 and 4.39-4.40, $\mathrm{Q}(n-2, w, \gamma)$ is equivalent to $\ell\left(\left\lfloor w r_{\gamma}\right\rfloor\right)-\ell(w)=-n$. We check at once that ( $\mathrm{q}-\mathrm{D} 1$ ) and $i=n-2$ imply (103) and (i) or (ii) in the proof of Lemma 4.49. Then (1)-(9) in the proof of Lemma 4.49 yield $\ell\left(\left\lfloor w r_{\gamma}\right\rfloor\right)-\ell(w)=-n$.
Lemma 4.51. $n=4, c_{2}\left(\gamma^{\vee}\right)=1$, and $\mathrm{Q}(2, w, \gamma)$ imply ( $\mathrm{q}-\mathrm{D} 1$ ).
Proof. Assume that $n=4$ and $c_{2}\left(\gamma^{\vee}\right)=1$, and that $\mathrm{Q}(2, w, \gamma)$ is true. By Lemmas 4.4 and 4.39 , we have $\gamma^{\vee}=\varepsilon_{2}-\varepsilon_{3} \in Q^{\vee, I \backslash\{2\}}$, $r_{\gamma}=\left(\begin{array}{ll}2 & 3\end{array}\right)(\overline{2} \overline{3})$, and $\left\lfloor w r_{\gamma}\right\rfloor=$ $w r_{\gamma}\left(z_{\gamma^{\vee}}^{I \backslash\{2\}}\right)^{-1}$. Let $I \backslash\{2\}=I_{1} \sqcup I_{2}^{\prime} \sqcup I_{2}^{\prime \prime}$, where $I_{1}=\{1\}, I_{2}^{\prime}=\{3\}$, and $I_{2}^{\prime \prime}=\{4\}$ are of type $A_{1}$. We see that $(1,3,4) \in\left(I_{1}\right)_{\mathrm{af}} \times\left(I_{2}^{\prime}\right)_{\mathrm{af}} \times\left(I_{2}^{\prime \prime}\right)_{\mathrm{af}}$ satisfies the condition for $\gamma^{\vee} \in Q^{\vee}$ in Lemma 4.1. Hence $z_{\gamma^{\vee}}^{I \backslash\{2\}}=r_{1} r_{3} r_{4}=(12)(\overline{1} \overline{2})(3 \overline{3})(4 \overline{4})$. Then $\left\lfloor w r_{\gamma}\right\rfloor$ is
given by $1 \mapsto w(3), 2 \mapsto w(1), 3 \mapsto w(\overline{2})$, and $4 \mapsto w(\overline{4})$. It follows from Lemma 4.35 that

$$
\begin{equation*}
w(3) \prec w(1) \prec w(2), \quad w(3) \prec w(4) \prec w(\overline{3}), \quad w(\overline{2}) \prec w(4) \prec w(2) ; \tag{104}
\end{equation*}
$$

all $w \in W^{I \backslash\{2\}}$ satisfying (104) are listed in Table 1 below. It is easy to check that each $w$ in the table satisfies (q-D1) for $n=4$ and $i=2$.

Table 1.

| $w(1)$ | $w(2)$ | $w(3)$ | $w(4)$ | $\left\lfloor w r_{\gamma}\right\rfloor(1)$ | $\left\lfloor w r_{\gamma}\right\rfloor(2)$ | $\left\lfloor w r_{\gamma}\right\rfloor(3)$ | $\left\lfloor w r_{\gamma}\right\rfloor(4)$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 2 | $\overline{3}$ | 1 | $\overline{4}$ | 1 | 2 | 3 | 4 |
| 3 | $\overline{2}$ | 1 | $\overline{4}$ | 1 | 3 | 2 | 4 |
| 3 | $\overline{1}$ | 2 | $\overline{4}$ | 2 | 3 | 1 | 4 |
| 4 | $\overline{2}$ | 1 | $\overline{3}$ | 1 | 4 | 2 | 3 |

Lemma 4.52. $n=4, i=2$, and ( $\mathrm{q}-\mathrm{D} 1$ ) imply $\mathrm{Q}(2, w, \gamma)$.
Proof. Assume that $n=4, i=2$, and (q-D1) hold. By Lemmas 4.5 and 4.394.40, $\mathrm{Q}(2, w, \gamma)$ is equivalent to $\ell\left(\left\lfloor w r_{\gamma}\right\rfloor\right)-\ell(w)=-4$. We see that (q-D1) implies $\left\lfloor w r_{\gamma}\right\rfloor(1) \prec\left\lfloor w r_{\gamma}\right\rfloor(2)=w(1) \prec w(2),[4] \backslash\{\|w(1)\|\}=\left\{1<a_{2}<a_{3}\right\}$, and $\left\{w(\overline{2}),\left\lfloor w r_{\gamma}\right\rfloor(1)\right\}=\left\{1, a_{2}\right\}$. For this to happen, $w$ must be one of the ten elements listed in Table 1. In either case, it is easy to check that $\ell\left(\left\lfloor w r_{\gamma}\right\rfloor\right)-\ell(w)=-4$.
Lemma 4.53. $n \geqslant 5, c_{2}\left(\gamma^{\vee}\right)=2$, and $\mathrm{Q}(2, w, \gamma)$ imply ( $\mathrm{q}-\mathrm{D} 2$ ).
Proof. Assume that $n \geqslant 5$ and $c_{2}\left(\gamma^{\vee}\right)=2$, and that $\mathrm{Q}(2, w, \gamma)$ is true. By Lemmas 4.5 and 4.39-4.40, we have $\ell\left(\left\lfloor w r_{\gamma}\right\rfloor\right)-\ell(w)=7-4 n$. By Lemmas 4.4 and 4.39, we have $\gamma^{\vee}=\varepsilon_{1}+\varepsilon_{2} \in Q^{\vee, I \backslash\{2\}}, r_{\gamma}=\binom{1}{\overline{2}}(\overline{1} 2)$, and $\left\lfloor w r_{\gamma}\right\rfloor=w r_{\gamma}\left(z_{\gamma^{\vee}}^{I \backslash\{2\}}\right)^{-1}$. Let $I \backslash\{2\}=I_{1} \sqcup I_{2}$, where $I_{1}=\{1\}$ is of type $A_{1}$ and $I_{2}=[3, n]$ is of type $D_{n-2}$. We see that $(0,0) \in\left(I_{1}\right)_{\text {af }} \times\left(I_{2}\right)_{\text {af }}$ satisfies the condition for $\gamma^{\vee} \in Q^{\vee}$ in Lemma 4.1. Hence $\left\lfloor w r_{\gamma}\right\rfloor=w r_{\gamma}$ acts by $1 \mapsto w(\overline{2}), 2 \mapsto w(\overline{1})$, and $u \mapsto w(u)$ for $u \in[3, n]$. The proof will be divided into three steps.
Step 1. We show that $w(1) \prec w(2) \preceq n$ leads to a contradiction. Suppose that $w(1) \prec$ $w(2) \preceq n$. Then $w(n) \preceq n$, by (90). It follows from Lemma 4.35 that $\mathrm{a}_{1}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=$ $\mathrm{a}_{2}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=n-2, \mathrm{~b}_{1}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=n-w(2)+1, \mathrm{~b}_{2}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=n-w(1)-1, \mathrm{a}_{1}(w)=$ $w(1)-1, \mathrm{a}_{2}(w)=w(2)-2$, and $\mathrm{b}_{1}(w)=\mathrm{b}_{2}(w)=0$. Hence $\ell\left(\left\lfloor w r_{\gamma}\right\rfloor\right)-\ell(w)=$ $4 n-1-2 w(1)-2 w(2)>7-4 n$, a contradiction.

Step 2. We show that $w(1) \preceq n$ and $\bar{n} \preceq w(2)$ lead to a contradiction. Suppose that $w(1) \preceq n$ and $\bar{n} \preceq w(2)$. Then $w(\bar{n}) \preceq n$, by (90). We have the following cases:
(i) $w(1) \prec w(\overline{2}) \prec w(\bar{n}) \preceq n$,
(ii) $w(1) \prec w(\bar{n}) \prec w(\overline{2}) \preceq n$,
(iii) $w(\overline{2}) \prec w(1) \prec w(\bar{n}) \preceq n$,
(iv) $w(\overline{2}) \prec w(\bar{n}) \prec w(1) \preceq n$,
(v) $w(\bar{n}) \prec w(1) \prec w(\overline{2}) \preceq n$,
(vi) $w(\bar{n}) \prec w(\overline{2}) \prec w(1) \preceq n$.

It follows from Lemma 4.35 that
(1) $\mathrm{a}_{1}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)= \begin{cases}w(\overline{2})-1 & \text { if (iii) or (iv), } \\ w(\overline{2})-2 & \text { if (i) or (vi), } \\ w(\overline{2})-3 & \text { if (ii) or (v), }\end{cases}$
(2) $\mathrm{a}_{2}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)= \begin{cases}n-2 & \text { if (i), (ii), or (iii), } \\ n-3 & \text { if (iv), (v), or (vi), }\end{cases}$
(3) $\mathrm{b}_{1}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)= \begin{cases}0 & \text { if (iii) or (iv), } \\ 1 & \text { if (i) or (vi), } \\ 2 & \text { if (ii) or (v), }\end{cases}$
(4) $\mathbf{b}_{2}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)= \begin{cases}n-w(1)-1 & \text { if (i) or (ii), } \\ n-w(1) & \text { if (iii) or (v), } \\ n-w(1)+1 & \text { if (iv) or (vi), }\end{cases}$
(5) $\mathrm{a}_{1}(w)= \begin{cases}w(1)-3 & \text { if (iv) or (vi), } \\ w(1)-2 & \text { if (iii) or (v), } \\ w(1)-1 & \text { if (i) or (ii), }\end{cases}$
(6) $\mathrm{a}_{2}(w)= \begin{cases}n-3 & \text { if (ii), (v) or (vi), } \\ n-2 & \text { if (i), (iii) or (iv), }\end{cases}$
(7) $\mathrm{b}_{1}(w)= \begin{cases}0 & \text { if (i) or (ii), } \\ 1 & \text { if (iii) or (v), } \\ 2 & \text { if (iv) or (vi) }\end{cases}$
(8) $\mathbf{b}_{2}(w)= \begin{cases}n-w(\overline{2})-1 & \text { if (iii) or (iv), } \\ n-w(\overline{2}) & \text { if (i) or (vi), } \\ n-w(\overline{2})+1 & \text { if (ii) or (v). }\end{cases}$

Hence

$$
\ell\left(\left\lfloor w r_{\gamma}\right\rfloor\right)-\ell(w)= \begin{cases}2 w(\overline{2})-2 w(1)-1 & \text { if (i), (ii), or (v) }  \tag{105}\\ 2 w(\overline{2})-2 w(1)+1 & \text { if (iii), (iv) or (vi). }\end{cases}
$$

If (i), (ii), or (v) hold, then $2 w(\overline{2})-2 w(1)-1>0$, contrary to $\ell\left(\left\lfloor w r_{\gamma}\right\rfloor\right)-\ell(w)=$ $7-4 n<0$. If (iii), (iv), or (vi) hold, then $1 \leqslant w(\overline{2}) \leqslant w(1) \leqslant n$ and $2 w(\overline{2})-2 w(1)+1 \geqslant$ $3-2 n$, contrary to $\ell\left(\left\lfloor w r_{\gamma}\right\rfloor\right)-\ell(w)=7-4 n$ and $n \geqslant 5$.

Step 3. By Steps $1-2$, we have $\bar{n} \preceq w(1) \prec w(2)$; note that $w(n) \preceq n$, by (90). It remains to prove that $w(\overline{1})=2$ and $w(\overline{2})=1$. It follows from Lemma 4.35 that $\mathrm{a}_{1}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=w(\overline{2})-1, \mathrm{a}_{2}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=w(\overline{1})-2, \mathrm{~b}_{1}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=\mathrm{b}_{2}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=0, \mathrm{a}_{1}(w)=$ $\mathrm{a}_{2}(w)=n-2, \mathrm{~b}_{1}(w)=(n-1)-(w(\overline{1})-2)$, and $\mathrm{b}_{2}(w)=(n-2)-(w(\overline{2})-1)$. Hence $\ell\left(\left\lfloor w r_{\gamma}\right\rfloor\right)-\ell(w)=7-4 n+2(w(\overline{2})-1)+2(w(\overline{1})-2)$; note that $w(\overline{2})-1 \geqslant 0$ and $w(\overline{1})-2 \geqslant 0$. Since $\ell\left(\left\lfloor w r_{\gamma}\right\rfloor\right)-\ell(w)=7-4 n$, we conclude that $w(\overline{1})=2$ and $w(\overline{2})=1$.

The proof of Lemma 4.53 is complete.
Lemma 4.54. $n \geqslant 5, i=2$, and ( $\mathrm{q}-\mathrm{D} 2$ ) imply $\mathrm{Q}(2, w, \gamma)$.
Proof. Assume that $n \geqslant 5, i=2$, and (q-D2) hold. By Lemmas 4.5 and 4.39-4.40, $\mathrm{Q}(2, w, \gamma)$ is equivalent to $\ell\left(\left\lfloor w r_{\gamma}\right\rfloor\right)-\ell(w)=7-4 n$. It follows from Lemma 4.35 that $w=r_{\gamma}=\binom{1}{2}(\overline{1} 2)$ and $\left\lfloor w r_{\gamma}\right\rfloor=e$. We check at once that $\ell\left(\left\lfloor w r_{\gamma}\right\rfloor\right)-\ell(w)=$ $7-4 n$.

Lemma 4.55. $n \geqslant 5$, $i \in[3, n-3], c_{i}\left(\gamma^{\vee}\right)=2$, and $\mathrm{Q}(i, w, \gamma)$ imply ( $\mathrm{q}-\mathrm{D} 2$ ).
Proof. Assume that $n \geqslant 5, i \in[3, n-3]$, and $c_{i}\left(\gamma^{\vee}\right)=2$, and that $\mathrm{Q}(i, w, \gamma)$ is true. By Lemmas 4.5 and 4.39-4.40, we have $\ell\left(\left\lfloor w r_{\gamma}\right\rfloor\right)-\ell(w)=3-4 n+2 i$. By Lemmas 4.4 and 4.39, we have $\gamma^{\vee}=\varepsilon_{i-1}+\varepsilon_{i} \in Q^{\vee, I \backslash\{i\}}, r_{\gamma}=(i-1 \bar{i})(\overline{i-1} i)$, and $\left\lfloor w r_{\gamma}\right\rfloor=w r_{\gamma}\left(z_{\gamma^{\vee}}^{I \backslash\{i\}}\right)^{-1}$. Let $I \backslash\{i\}=I_{1} \sqcup I_{2}$, where $I_{1}=[i-1]$ is of type $A_{i-1}$ and $I_{2}=[i+1, n]$ is of type $D_{n-i}$. We see that $(i-2,0) \in\left(I_{1}\right)_{\text {af }} \times\left(I_{2}\right)_{\text {af }}$ satisfies the condition for $\gamma^{\vee} \in Q^{\vee}$ in Lemma 4.1; note that $I_{1} \backslash\{i-2\}$ is of type $A_{i-3} \times A_{1}$. Hence $z_{\gamma \vee}^{I \backslash\{i\}}=w_{0}^{I_{1}} w_{0}^{I_{1} \backslash\{i-2\}}$ is given by $1 \mapsto i-1,2 \mapsto i, u \mapsto u-2$ for $u \in[3, i]$, and $u \mapsto u$ for $u \in[i+1, n]$. Then $\left\lfloor w r_{\gamma}\right\rfloor$ is given by $1 \mapsto w(\bar{i}), 2 \mapsto w(\overline{i-1}), u \mapsto w(u-2)$ for $u \in[3, i]$, and $u \mapsto w(u)$ for $u \in[i+1, n]$. It follows from Lemma 4.35 that

$$
\begin{align*}
& w(\bar{i}) \prec \underbrace{w(\overline{i-1})}_{\preceq n} \prec w(1) \prec w(2) \prec \cdots \prec \underbrace{w(i-1)}_{\succeq \bar{n}} \prec w(i), \\
& w(i+1) \prec w(i+2) \prec \cdots \prec \underbrace{w(n-1)}_{\preceq n} \prec w(n) \prec w(\overline{n-1}) . \tag{106}
\end{align*}
$$

We have the following cases:
(i) $w(n) \prec w(i-1) \prec w(i)$,
(ii) $w(i-1) \prec w(n) \prec w(i)$,
(iii) $w(i-1) \prec w(i) \prec w(n)$;
we will prove that (i) holds. It follows from (106) that
(1) $\mathrm{a}_{1}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=w(\bar{i})-1, \mathrm{a}_{2}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=w(\overline{i-1})-2$,
(2) $\mathrm{b}_{1}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=\left\{\begin{array}{ll}0 & \text { if (i) or (ii), } \\ 1 & \text { if (iii), }\end{array} \mathrm{b}_{2}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)= \begin{cases}0 & \text { if (i), } \\ 1 & \text { if (ii) or (iii), }\end{cases}\right.$
(3) for $s \in[3, i], \mathrm{a}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=\mathrm{a}_{s-2}(w)$ and $\mathrm{b}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=\mathrm{b}_{s-2}(w)-2$,
(4) $\mathrm{a}_{i-1}(w)=\left\{\begin{array}{ll}n-i & \text { if (i), } \\ n-i-1 & \text { if (ii) or (iii), }\end{array} \quad \mathrm{a}_{i}(w)= \begin{cases}n-i & \text { if (i) or (ii), } \\ n-i-1 & \text { if (iii), }\end{cases}\right.$
(5) $\mathrm{b}_{i-1}(w)=n-i+1-(w(\overline{i-1})-2)$ and $\mathrm{b}_{i}(w)=n-i-(w(\bar{i})-1)$.

Hence

$$
\ell\left(\left\lfloor w r_{\gamma}\right\rfloor\right)-\ell(w)= \begin{cases}3-4 n+2 i+2(w(\bar{i})-1)+2(w(\overline{i-1})-2) & \text { if (i) }  \tag{107}\\ 5-4 n+2 i+2(w(\bar{i})-1)+2(w(\overline{i-1})-2) & \text { if (ii), } \\ 7-4 n+2 i+2(w(\bar{i})-1)+2(w(\overline{i-1})-2) & \text { if (iii) }\end{cases}
$$

note that $w(\bar{i})-1 \geqslant 0$ and $w(\overline{i-1})-2 \geqslant 0$. Since $\ell\left(\left\lfloor w r_{\gamma}\right\rfloor\right)-\ell(w)=3-4 n+2 i$, we have (i), $w(\bar{i})=1$, and $w(\overline{i-1})=2$. This implies ( $\mathrm{q}-\mathrm{D} 2$ ).
Lemma 4.56. $n \geqslant 5, i \in[3, n-3]$, and ( $\mathrm{q}-\mathrm{D} 2$ ) imply $\mathrm{Q}(i, w, \gamma)$.
Proof. Assume that $n \geqslant 5, i \in[3, n-3]$, and (q-D2) hold. By Lemmas 4.5 and 4.394.40, $\mathrm{Q}(i, w, \gamma)$ is equivalent to $\ell\left(\left\lfloor w r_{\gamma}\right\rfloor\right)-\ell(w)=3-4 n+2 i$. We check at once that (q-D2) yields $w(n) \prec w(i-1) \prec w(i)$ and (106). As in the proof of Lemma 4.55, we have $\ell\left(\left\lfloor w r_{\gamma}\right\rfloor\right)-\ell(w)=3-4 n+2 i+2(w(\overline{1})-1)+2(w(\overline{i-1})-2)$. Since $w(\overline{1})=1$ and $w(\overline{i-1})=2$, we conclude that $\ell\left(\left\lfloor w r_{\gamma}\right\rfloor\right)-\ell(w)=3-4 n+2 i$.

Lemma 4.57. $n \geqslant 5, c_{n-2}\left(\gamma^{\vee}\right)=2$, and $\mathrm{Q}(n-2, w, \gamma)$ imply ( $\mathrm{q}-\mathrm{D} 2$ ).
Proof. Assume that $n \geqslant 5$ and $c_{n-2}\left(\gamma^{\vee}\right)=2$, and that $\mathrm{Q}(n-2, w, \gamma)$ is true. By Lemmas 4.5 and 4.39-4.40, we have $\ell\left(\left\lfloor w r_{\gamma}\right\rfloor\right)-\ell(w)=-1-2 n$. By Lemmas 4.4 and 4.39, we have $\gamma^{\vee}=\varepsilon_{n-3}+\varepsilon_{n-2} \in Q^{\vee, I \backslash\{n-2\}}, r_{\gamma}=(n-3 \overline{n-2})(\overline{n-3} n-2)$, and $\left\lfloor w r_{\gamma}\right\rfloor=w r_{\gamma}\left(z_{\gamma^{\vee}}^{I \backslash\{n-2\}}\right)^{-1}$. Let $I \backslash\{n-2\}=I_{1} \sqcup I_{2}^{\prime} \sqcup I_{2}^{\prime \prime}$, where $I_{1}=[n-3]$ is of
type $A_{n-3}, I_{2}^{\prime}=\{n-1\}$ is of type $A_{1}$, and $I_{2}^{\prime \prime}=\{n\}$ is of type $A_{1}$. We see that $(n-4,0,0) \in\left(I_{1}\right)_{\text {af }} \times\left(I_{2}^{\prime}\right)_{\text {af }} \times\left(I_{2}^{\prime \prime}\right)_{\text {af }}$ satisfies the condition for $\gamma^{\vee} \in Q^{\vee}$ in Lemma 4.1; note that $I_{1} \backslash\{n-4\}$ is of type $A_{n-5} \times A_{1}$. Hence $z_{\gamma^{\vee}}^{I \backslash\{n-2\}}=w_{0}^{I_{1}} w_{0}^{I_{1} \backslash\{n-4\}}$ is given by $u \mapsto u+2$ for $u \in[n-4], n-3 \mapsto 1, n-2 \mapsto 2, n-1 \mapsto n-1$, and $n \mapsto n$. Then $\left\lfloor w r_{\gamma}\right\rfloor$ is given by $1 \mapsto w(\overline{n-2}), 2 \mapsto w(\overline{n-3}), u \mapsto w(u-2)$ for $u \in[3, n-2]$, $n-1 \mapsto w(n-1)$, and $n \mapsto w(n)$. It follows from Lemma 4.35 that

$$
\begin{align*}
& w(\overline{n-2}) \prec w(\overline{n-3}) \prec w(1) \prec w(2) \prec \cdots \prec w(n-3) \prec w(n-2), \\
& w(n-1) \prec w(n) \prec w(\overline{n-1}) . \tag{108}
\end{align*}
$$

Analysis similar to that in the proof of Lemma 4.55 shows that $w(\overline{n-2})=1$ and $w(\overline{n-3})=2$. This implies (q-D2).
Lemma 4.58. $n \geqslant 5, i=n-2$, and ( $\mathrm{q}-\mathrm{D} 2$ ) imply $\mathrm{Q}(n-2, w, \gamma)$.
Proof. Assume that $n \geqslant 5, i=n-2$, and (q-D2) hold. By Lemmas 4.5 and 4.39-4.40, $\mathrm{Q}(n-2, w, \gamma)$ is equivalent to $\ell\left(\left\lfloor w r_{\gamma}\right\rfloor\right)-\ell(w)=-1-2 n$. We see that $i=n-2$ and (q-D2) imply (108). Hence $\mathrm{a}_{1}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=\mathrm{a}_{2}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=\mathrm{b}_{1}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=\mathrm{b}_{2}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=0$, $\mathrm{A}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=\mathrm{A}_{s-2}(w)$ for $s \in[3, n-2], \mathrm{A}_{n-3}(w)=\mathrm{A}_{n-2}(w)=\mathrm{B}_{n-2}(w)=\{n-1, n\}$, and $\mathrm{B}_{n-3}(w)=\{n-2, n-1, n\}$. Also, for $s \in[3, n-2]$, we see that $n-3, n-2 \in$ $\mathrm{B}_{s-2}(w)$ and the map below is bijective.

$$
\mathrm{B}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right) \rightarrow \mathrm{B}_{s-2}(w) \backslash\{n-3, n-2\}, \begin{cases}t \mapsto t-2 & \text { if } t \in[s+1, n-2]  \tag{109}\\ t \mapsto t & \text { if } t \in\{n-1, n\}\end{cases}
$$

This implies $\mathrm{b}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=\mathrm{b}_{s-2}(w)-2$ for $s \in[3, n-2]$. Combining these yields $\ell\left(\left\lfloor w r_{\gamma}\right\rfloor\right)-\ell(w)=-1-2 n$.
Lemma 4.59. $n=4, c_{2}\left(\gamma^{\vee}\right)=2$, and $\mathrm{Q}(2, w, \gamma)$ are equivalent to ( $\mathrm{q}-\mathrm{D} 2$ ).
Proof. The assertion follows by the same method as in the proof of Lemmas 4.53-4.54; in this case, we have $w=(1 \overline{2})(\overline{1} 2)$ and $\left\lfloor w r_{\gamma}\right\rfloor=e$.
Lemma 4.60. $\mathrm{Q}(n-1, w, \gamma)$ implies ( $\mathrm{q}-\mathrm{D} 3$ ).
Proof. Assume that $\mathrm{Q}(n-1, w, \gamma)$ is true. By Lemmas 4.4 and 4.39, we have $\gamma^{\vee}=$ $\varepsilon_{n-1}-\varepsilon_{n} \in Q^{\vee, I \backslash\{n-1\}}, r_{\gamma}=(n-1 n)(\overline{n-1} \bar{n})$, and $\left\lfloor w r_{\gamma}\right\rfloor=w r_{\gamma}\left(z_{\gamma^{\vee}}^{I \backslash\{n-1\}}\right)^{-1}$. Set $J \backslash\{n-1\}$; note that $J$ is of type $A_{n-1}$. We see that $n-2 \in J_{\mathrm{af}}$ satisfies the condition for $\gamma^{\vee} \in Q^{\vee}$ in Lemma 4.1; note that $J \backslash\{n-2\}$ is of type $A_{n-3} \times A_{1}$. Hence $z_{\gamma^{\vee}}^{I \backslash\{n-1\}}$ is given by $u \mapsto u+2$ for $u \in[n-3], n-2 \mapsto \bar{n}, n-1 \mapsto 1$, and $n \mapsto \overline{2}$. Then $\left\lfloor w r_{\gamma}\right\rfloor$ is given by $1 \mapsto w(n), 2 \mapsto w(\overline{n-1}), u \mapsto w(u-2)$ for $u \in[3, n-1]$, and $n \mapsto w(\overline{n-2})$. It follows from Lemma 4.35 that

$$
\begin{equation*}
w(n) \prec w(\overline{n-1}) \prec w(1) \prec w(2) \prec \cdots \prec w(n-2) \prec w(n-1) \prec w(\bar{n}) \tag{110}
\end{equation*}
$$

which implies $w(n)=1$ and $w(n-1)=\overline{2}$. This completes the proof.
Lemma 4.61. ( $\mathrm{q}-\mathrm{D} 3$ ) implies $\mathrm{Q}(n-1, w, \gamma)$.
Proof. Assume that (q-D3) is true. By Lemmas 4.5 and 4.39-4.40, $\mathrm{Q}(n-1, w, \gamma)$ is equivalent to $\ell\left(\left\lfloor w r_{\gamma}\right\rfloor\right)-\ell(w)=3-2 n$. We check at once that (q-D3) implies (110). It follows that
(1) $\mathrm{a}_{1}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=\mathrm{a}_{2}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=\mathrm{b}_{1}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=\mathrm{b}_{2}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=0$,
(2) for $s \in[3, n-1], \mathrm{A}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor=\left\{\begin{array}{ll}\varnothing & \text { if } w(s-2) \prec w(\overline{n-2}), \\ \{n\} & \text { if } w(s-2) \succ w(\overline{n-2}),\end{array} \quad \mathrm{A}_{s-2}(w)=\{n\}\right.\right.$,
(3) for $s \in[3, n-1], \mathrm{b}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)-\mathrm{b}_{s-2}(w)= \begin{cases}-1 & \text { if } w(s-2) \prec w(\overline{n-2}), \\ -2 & \text { if } w(s-2) \succ w(\overline{n-2}),\end{cases}$
(4) $\mathrm{A}_{n-2}(w)=\mathrm{A}_{n-1}(w)=\{n\}, \mathrm{B}_{n-2}(w)=\{n-1\}, \mathrm{B}_{n-1}(w)=\varnothing$.

We give the proof only for (3). Let $s \in[3, n-1]$. We have $n-1 \in \mathrm{~B}_{s-2}(w)$ and $n \notin \mathrm{~B}_{s-2}(w)$. We see that $n-2 \in \mathrm{~B}_{s-2}(w)$ if and only if $w(s-2) \succ w(\overline{n-2})$. Then the map

$$
\begin{equation*}
\mathrm{B}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right) \rightarrow \mathrm{B}_{s-2}(w) \backslash\{n-2, n-1\}, t \mapsto t-2 \tag{111}
\end{equation*}
$$

is bijective. Combining these yields (3). By (1)-(4) above, we have $\ell\left(\left\lfloor w r_{\gamma}\right\rfloor\right)-\ell(w)=$ $3-2 n$.

Lemma 4.62. $\mathrm{Q}(n, w, \gamma)$ implies ( $\mathrm{q}-\mathrm{D} 4$ ).
Proof. Assume that $\mathrm{Q}(n, w, \gamma)$ is true. By Lemmas 4.4 and 4.39, we have $\gamma^{\vee}=\varepsilon_{n-1}+$ $\varepsilon_{n} \in Q^{\vee, I \backslash\{n\}}, r_{\gamma}=(n-1 \bar{n})(\overline{n-1} n)$, and $\left\lfloor w r_{\gamma}\right\rfloor=w r_{\gamma}\left(z_{\gamma^{\vee}}^{I \backslash\{n\}}\right)^{-1}$. Set $J=$ $I \backslash\{n\}=[n-1]$; note that $J$ is of type $A_{n-1}$. We see that $n-2 \in J_{\text {af }}$ satisfies the condition for $\gamma^{\vee} \in Q^{\vee}$ in Lemma 4.1; note that $J \backslash\{n-2\}$ is of type $A_{n-3} \times A_{1}$. Hence $z_{\gamma^{\vee}}^{I \backslash\{n\}}$ is given by $u \mapsto u+2$ for $u \in[n-2], n-1 \mapsto 1$, and $n \mapsto 2$. Then $\left\lfloor w r_{\gamma}\right\rfloor$ is given by $1 \mapsto w(\bar{n}), 2 \mapsto w(\overline{n-1})$, and $u \mapsto w(u-2)$ for $u \in[3, n]$. It follows from Lemma 4.35 that

$$
\begin{equation*}
w(\bar{n}) \prec w(\overline{n-1}) \prec w(1) \prec w(2) \prec \cdots \prec w(n-2) \prec w(n-1) \prec w(n) \tag{112}
\end{equation*}
$$

which implies $w(n)=\overline{1}$ and $w(n-1)=\overline{2}$. This completes the proof.
Lemma 4.63. (q-D4) implies $\mathrm{Q}(n, w, \gamma)$.
Proof. Assume that (q-D4) is true. By Lemmas 4.5 and 4.39-4.40, $\mathrm{Q}(n, w, \gamma)$ is equivalent to $\ell\left(\left\lfloor w r_{\gamma}\right\rfloor\right)-\ell(w)=3-2 n$. We check at once that (q-D4) implies (112). Hence $\mathrm{A}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=\mathrm{A}_{s}(w)=\varnothing$ for $s \in[n], \mathrm{B}_{1}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=\mathrm{B}_{2}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=\mathrm{B}_{n}(w)=\varnothing$, $\mathrm{B}_{n-1}(w)=\{n\}$, and the map $\mathrm{B}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right) \rightarrow \mathrm{B}_{s-2}(w) \backslash\{n-1, n\}, t \mapsto t-2$, is bijective for $s \in[3, n]$. Since $n-1, n \in \mathrm{~B}_{s-2}(w)$ for $s \in[3, n]$, we have $\mathrm{b}_{s}\left(\left\lfloor w r_{\gamma}\right\rfloor\right)=\mathrm{b}_{s-2}(w)-2$ for $s \in[3, n]$. It follows that $\ell\left(\left\lfloor w r_{\gamma}\right\rfloor\right)-\ell(w)=3-2 n$.
Proof of Proposition 4.37. (1) and (3)-(4) follow by the same method as in the proof of Proposition 4.8.

We prove (2). We can prove the assertion for $i \in\{1, n-1, n\}$ by a similar argument to the proof of Proposition 4.13. Assume that $i \in[2, n-2]$. Let $x, y \in\left(W^{I \backslash\{i\}}\right)_{\mathrm{af}}$, $\mathcal{Y}_{i}^{D_{n}}(x)=(\mathrm{T}, c)$, and $\mathcal{Y}_{i}^{D_{n}}(y)=\left(\mathrm{T}^{\prime}, c^{\prime}\right)$. It follows immediately from Propositions 4.41-4.43 that $x \preceq y$ implies $c \leqslant c^{\prime}$ and $\mathrm{T}(u) \preceq \mathrm{T}^{\prime}\left(u+c^{\prime}-c\right)$ for $u \in\left[i-c^{\prime}+\right.$ $c]$. Hence we may assume that $d:=c^{\prime}-c \geqslant 0$ and $\mathrm{T}(u) \preceq \mathrm{T}^{\prime}(u+d)$ for $u \in$ $[i-d]$. If $d$ is even, then the assertion follows by the same method as in Step 1 of the proof of Proposition 4.21. In what follows, assume that $d \geqslant 1$ is odd. Write $a=\min ([n] \backslash\{\|\mathrm{T}(u)\| \mid u \in[i], \mathrm{T}(u) \succeq \bar{n}\})$ and $b=\min ([n] \backslash\{\|\mathrm{T}(u)\| \mid u \in[i]\})$ (see (98) in Definition 4.36 (1)). Let $\left\{a_{1}<a_{2}<\cdots<a_{n-i+1}\right\}=[n] \backslash\{\|\mathrm{T}(u)\| \mid u \in$ $[i-1]\}$. We divide the proof into four steps.
Step 1. We show that $\mathrm{T}(i) \preceq n$ implies $x \prec y$. Define $\mathrm{T}_{1}, \mathrm{~T}_{2} \in \operatorname{CST}_{D_{n}}\left(\varpi_{i}\right)$ by

$$
\begin{align*}
& \mathrm{T}_{1}(u)= \begin{cases}u+1 & \text { if } u \in\left[a_{2}-2\right], \\
\mathrm{T}(u) & \text { if } u \in\left[a_{2}-1, i-1\right], \\
\overline{a_{2}} & \text { if } u=i,\end{cases}  \tag{113}\\
& \mathrm{T}_{2}(u)= \begin{cases}u & \text { if } u \in\left[a_{2}-1\right], \\
\mathrm{T}(u-1) & \text { if } u \in\left[a_{2}, i\right] .\end{cases} \tag{114}
\end{align*}
$$

Let $x_{1}, x_{2} \in\left(W^{I \backslash\{i\}}\right)_{\text {af }}$ be such that $\mathcal{Y}_{i}^{D_{n}}\left(x_{1}\right)=\left(\mathrm{T}_{1}, c\right)$ and $\mathcal{Y}_{i}^{D_{n}}\left(x_{2}\right)=\left(\mathrm{T}_{2}, c+1\right)$. Since $\mathbf{T}(u) \preceq \mathrm{T}_{1}(u)$ for $u \in[i]$, we have $x \preceq x_{1}$ by the assertion for $d=0$. We have $x_{1} \prec x_{2}$ by Proposition 4.43 ( $\frac{\infty}{2}$-D8). We have $x_{2} \prec y$ because $c^{\prime}-(c+1)=d-1 \geqslant 0$ is even and $\mathrm{T}_{2}(u) \preceq \mathrm{T}^{\prime}(u+d-1)$ for $u \in[i-d+1]$. Combining these we conclude that $x \prec y$.
Step 2. We show that ( $\mathrm{T}(i) \succeq \bar{n}, a=b$, and $d>i$ ) or ( $\mathrm{T}(i) \succeq \bar{n}, a=b, d \in[i]$, and $a \preceq \mathrm{~T}^{\prime}(d)$ ) imply $x \prec y$. Assume that $\mathrm{T}(i) \succeq \bar{n}$ and $a=b$; note that $a_{1}=1$ holds. We claim that $a \prec \mathrm{~T}(1)$. Indeed, if $\mathrm{T}(1) \succeq \bar{n}$, then $a \prec \mathrm{~T}(1)$. If $\mathrm{T}(1) \preceq n$, then $\mathrm{T}(1) \in[n] \backslash\{\|\mathrm{T}(u)\| \mid u \in[i], \mathrm{T}(u) \succeq \bar{n}\}$ and hence $a \preceq \mathrm{~T}(1)$ by minimality of $a$. Since $a=b \neq\|\mathbf{T}(u)\|$ for $u \in[i]$, we conclude that $a \prec \mathbf{T}(1)$. Thus $\mathrm{T}_{2} \in \mathrm{CST}_{D_{n}}\left(\varpi_{i}\right)$ below is well-defined.

$$
\begin{align*}
& \mathrm{T}_{1}(u)= \begin{cases}\mathrm{T}(u) & \text { if } u \in[i-1], \\
\max \left\{\overline{a_{2}}, \mathrm{~T}(i)\right\} & \text { if } u=i,\end{cases}  \tag{115}\\
& \mathrm{T}_{2}(u)= \begin{cases}a & \text { if } u=1, \\
\mathrm{~T}(u-1) & \text { if } u \in[2, i] .\end{cases} \tag{116}
\end{align*}
$$

Let $x_{1}, x_{2} \in\left(W^{I \backslash\{i\}}\right)_{\text {af }}$ be such that $\mathcal{Y}_{i}^{D_{n}}\left(x_{1}\right)=\left(\mathrm{T}_{1}, c\right)$ and $\mathcal{Y}_{i}^{D_{n}}\left(x_{2}\right)=\left(\mathrm{T}_{2}, c+1\right)$. Write $\left\{b_{1}<b_{2}<\cdots<b_{n-i+1}\right\}=[n] \backslash\left\{\left\|\mathrm{T}_{1}(u)\right\| \mid u \in[i-1]\right\}$; note that $a_{\nu}=b_{\nu}$ for $\nu \in[n-i+1]$. Since $\mathbf{T}(u) \preceq \mathrm{T}_{1}(u)$ for $u \in[i]$, we have $x \preceq x_{1}$ by the assertion for $d=0$. We claim that $x_{1} \prec x_{2}$. Indeed, if $\|\mathrm{T}(i)\|=a_{1}=1$, then $\mathrm{T}_{1}(i)=\overline{1}$ and $\mathrm{T}_{2}(1)=a=a_{2}$, which imply $b_{1}=\left\|\mathrm{T}_{1}(i)\right\|=1$ and $b_{2}=\mathrm{T}_{2}(1)$. If $a_{2} \leqslant\|\mathrm{~T}(i)\|$, then $\mathrm{T}_{1}(i)=\overline{a_{2}}$ and $a=1$, which imply $b_{1}=\mathrm{T}_{2}(1)=1$ and $b_{2}=\left\|\mathrm{T}_{1}(i)\right\|$. Proposition $4.43\left(\frac{\infty}{2}-\mathrm{D} 8\right)$ now yields $x_{1} \prec x_{2}$ as claimed. We claim that $x_{2} \preceq y$. Indeed, $c^{\prime}-(c+1)=d-1 \geqslant 0$ is even. If $d>i$, then the condition (97) is trivial, and hence $x_{2} \prec y$. If $d \in[i]$ and $a \preceq \mathrm{~T}^{\prime}(d)$, then $\mathrm{T}_{2}(1)=a \preceq \mathrm{~T}^{\prime}(d)=\mathrm{T}^{\prime}(1+(d-1)), \mathrm{T}_{2}(u)=\mathrm{T}(u-1) \preceq \mathrm{T}^{\prime}(u+(d-1))$ for $u \in[2, i-d+1]$, and hence $x_{2} \preceq y$ as claimed. Combining these we conclude that $x \prec y$.

Step 3. Assume that $\mathbf{T}(i) \succeq \bar{n}$ and $a<b$; note that $\mathbf{T}(1)=a$ holds. Let $k \in[i]$ be such that $\mathrm{T}(k) \prec b \prec \mathrm{~T}(k+1)$. In this case, we show that the condition (iii) in Definition 4.36 (1) implies $x \preceq y$. Define $\mathrm{T}_{1}, \mathrm{~T}_{2} \in \operatorname{CST}_{D_{n}}\left(\varpi_{i}\right)$ by

$$
\begin{align*}
& \mathrm{T}_{1}(u)= \begin{cases}\mathrm{T}(u+1) & \text { if } u \in[k-1], \\
b & \text { if } u=k, \\
\mathrm{~T}(u) & \text { if } u \in[k+1, i-1], \\
\max \left\{\overline{a_{2}}, \mathrm{~T}(i)\right\} & \text { if } u=i,\end{cases}  \tag{117}\\
& \mathrm{T}_{2}(u)= \begin{cases}a & \text { if } u=1, \\
\mathrm{~T}_{1}(u-1) & \text { if } u \in[2, i] .\end{cases} \tag{118}
\end{align*}
$$

If $k=1$, then $\mathrm{T}_{2}(2)=\mathrm{T}_{1}(1)=b \succ a$. If $k \in[2, i]$, then $\mathrm{T}_{2}(2)=\mathrm{T}_{1}(1)=$ $\mathrm{T}(2) \succ \mathrm{T}(1)=a$. Therefore $\mathrm{T}_{2}$ is well-defined. Let $x_{1}, x_{2} \in\left(W^{I \backslash\{i\}}\right)_{\text {af }}$ be such that $\mathcal{Y}_{i}^{D_{n}}\left(x_{1}\right)=\left(\mathrm{T}_{1}, c\right)$ and $\mathcal{Y}_{i}^{D_{n}}\left(x_{2}\right)=\left(\mathrm{T}_{2}, c+1\right)$. Write $\left\{b_{1}<b_{2}<\cdots<b_{n-i+1}\right\}=[n] \backslash$ $\left\{\left\|\mathbf{T}_{1}(u)\right\| \mid u \in[i-1]\right\}$. Since $\mathbf{T}(u) \preceq \mathbf{T}_{1}(u)$ for $u \in[i]$, we have $x \preceq x_{1}$ by the assertion for $d=0$. We claim that $x_{1} \prec x_{2}$. Indeed, if $\|\mathrm{T}(i)\|=a_{1}=1$, then $b_{1}=\left\|\mathrm{T}_{1}(i)\right\|=1$ and $b_{2}=\mathrm{T}_{2}(1)$. If $\|\mathrm{T}(i)\|=a_{1}>1$, then $\mathrm{T}_{1}(i)=\mathrm{T}(i), a=1$, and $b=a_{2}$, which imply $b_{1}=\mathrm{T}_{2}(1)=1$ and $b_{2}=\left\|\mathrm{T}_{1}(i)\right\|$. If $\|\mathrm{T}(i)\| \geqslant a_{2}$, then $\mathrm{T}_{1}(i)=\overline{a_{2}}, a=1$, and $b=a_{1}$, which imply $b_{1}=\mathrm{T}_{2}(1)=1$ and $b_{2}=\left\|\mathrm{T}_{1}(i)\right\|$. Proposition 4.43 ( $\left.\frac{\infty}{2}-\mathrm{D} 8\right)$ now yields $x_{1} \prec x_{2}$ as claimed. We claim that $x_{2} \preceq y$. Indeed, $c^{\prime}-(c+1)=d-1 \geqslant 0$ is even. If $d>i$, then the condition (97) is trivial, and hence $x_{2} \prec y$. If $d \in[i], a \preceq \mathrm{~T}^{\prime}(d)$, $\left(\mathbf{T}(u) \preceq \mathrm{T}^{\prime}(u+d-1)\right.$ for $\left.u \in[2, \min \{k, i-d+1\}]\right)$ and $\left(b \preceq \mathrm{~T}^{\prime}(k+d)\right.$ if $\left.k \in[i-d]\right)$,
then $\mathrm{T}_{2}(1)=a \preceq \mathrm{~T}^{\prime}(d)=\mathrm{T}^{\prime}(1+(d-1)), \mathrm{T}_{2}(u)=\mathrm{T}_{1}(u-1)=\mathrm{T}(u) \preceq \mathrm{T}^{\prime}(u+(d-1))$ for $u \in[2, \min \{k, i-d+1\}], \mathrm{T}_{2}(k+1)=b \preceq \mathrm{~T}^{\prime}(k+d)=\mathrm{T}^{\prime}(k+1+(d-1))$ if $k \in[i-d], \mathrm{T}_{2}(u)=\mathrm{T}(u-1) \preceq \mathrm{T}^{\prime}(u-1+d)=\mathrm{T}^{\prime}(u+(d-1))$ for $u \in[k+2, i-d+1]$, and hence $x_{2} \prec y$ as claimed. Combining these we conclude that $x \prec y$.

Step 4. We show that $x \prec y$ and $\mathrm{T}(i) \succeq \bar{n}$ imply $(\mathrm{T}, c) \prec\left(\mathrm{T}^{\prime}, c^{\prime}\right)$. By Proposition 4.37 (3), we may assume that $d \in[i]$. Let $\mathrm{T}_{1}, \mathrm{~T}_{2} \in \operatorname{CST}_{D_{n}}\left(\varpi_{i}\right)$ and $x_{1}, x_{2} \in\left(W^{I \backslash\{i\}}\right)_{\text {af }}$ be as in Steps 2-3. By the arguments in Steps 2-3, the edge $x_{1} \rightarrow x_{2}$ is of type ( $\frac{\infty}{2}$-D8). Note that $(\mathrm{T}, c) \prec\left(\mathrm{T}^{\prime}, c^{\prime}\right)$ is equivalent to $\mathrm{T}_{2}(u) \preceq \mathrm{T}^{\prime}(u+d-1)$ for $u \in[i-d+1]$ (see (iii) in Definition 4.36 (1)). Since $d$ is odd, we see from Proposition 4.43 that there exists an edge $x_{3} \xrightarrow{\beta} x_{4}, x_{3}, x_{4} \in\left(W^{I \backslash\{i\}}\right)_{\mathrm{af}}, \beta \in \Delta_{\mathrm{af}}^{+}$, in $\mathrm{SiB}^{I \backslash\{i\}}$ of type ( $\frac{\infty}{2}$-D8) such that $x \preceq x_{3}$ and $x_{4} \preceq y$; we may assume that there is no edges of type ( $\frac{\infty}{2}$-D8) in a directed path from $x$ to $x_{3}$ in $\mathrm{SiB}^{I \backslash\{i\}}$. Write $\mathcal{Y}_{i}^{D_{n}}\left(x_{3}\right)=\left(\mathrm{T}_{3}, c^{\prime \prime}\right)$ and $\mathcal{Y}_{i}^{D_{n}}\left(x_{4}\right)=\left(\mathrm{T}_{4}, c^{\prime \prime}+1\right)$. We see from Proposition 4.43 that $c^{\prime \prime}-c \geqslant 0$ and $c^{\prime}-\left(c^{\prime \prime}+1\right) \geqslant 0$ are both even. Set $d^{\prime}=c^{\prime \prime}-c$ and $d^{\prime \prime}=c^{\prime}-\left(c^{\prime \prime}+1\right)$; note that $d^{\prime}+d^{\prime \prime}+1=d$ and $d^{\prime}, d^{\prime \prime} \in[0, d-1]$. Since $x_{4} \preceq y$, we have $\mathrm{T}_{4}(u) \preceq \mathrm{T}^{\prime}\left(u+d^{\prime \prime}\right)$ for $u \in\left[i-d^{\prime \prime}\right]$. Hence $\left(\mathrm{T}_{2}(u) \preceq \mathrm{T}^{\prime}(u+d-1)\right.$ for $\left.u \in[i-d+1]\right)$ follows from $\left(\mathrm{T}_{2}(u) \preceq \mathrm{T}_{4}\left(u+d^{\prime}\right)\right.$ for $\left.u \in\left[i-d^{\prime}\right]\right)$.

We first claim that $\mathrm{T}_{2}(1) \preceq \mathrm{T}_{4}(1)$ if $d^{\prime}=0$. Assume that $d^{\prime}=0$. We first assume that $\mathrm{T}(i) \prec \overline{1}$. Then $\mathrm{T}_{1}(i) \prec \overline{1}$ and $\mathrm{T}_{2}(1)=1$ by $\left(\frac{\infty}{2}\right.$-D8). Hence $\mathrm{T}_{2}(1) \preceq \mathrm{T}_{4}(1)$. We next assume that $\mathrm{T}(i)=\overline{1}$. Then $\mathrm{T}_{3}(i)=\overline{1}$, because $x \preceq x_{3}$ and $d^{\prime}=0$. If we write $\left\{c_{1}<c_{2}<\cdots<c_{n-i+1}\right\}=[n] \backslash\left\{\left\|\mathrm{T}_{3}(u)\right\| \mid u \in[i-1]\right\}$, then $c_{1}=1$ and $\mathrm{T}_{4}(1)=c_{2}$ by ( $\frac{\infty}{2}$-D8). Also, we have $\mathrm{T}_{2}(1)=a=a_{2}$ by ( $\frac{\infty}{2}$-D8); note that if $a<b$, then $a_{2}=b_{2}$, where $b_{2}$ is as in Step 3, because T $(1)=a$ and we assume that $\mathrm{T}(i)=\overline{1}$. By the definition of $a,\left\{\mathrm{~T}(u) \mid u \in\left[i-a_{2}+1, i\right]\right\}=\left\{\overline{1}, \overline{2}, \ldots, \overline{a_{2}-1}\right\}$. Hence $\left\{\mathrm{T}_{3}(u) \mid u \in\left[i-a_{2}+1, i\right]\right\}=\left\{\overline{1}, \overline{2}, \ldots, \overline{a_{2}-1}\right\}$, because $x \preceq x_{3}$ and $d^{\prime}=0$. This implies $a_{2} \leqslant c_{2}$. Therefore $\mathrm{T}_{2}(1) \preceq \mathrm{T}_{4}(1)$.

We next claim that $\mathrm{T}_{2}(1) \preceq \mathrm{T}_{4}\left(1+d^{\prime}\right)$ if $d^{\prime} \neq 0$. Assume that $d^{\prime} \in[d-1]$ or $d^{\prime}=0$. Set

$$
\begin{align*}
\left\{p_{1}<p_{2}<\cdots<p_{\mu}\right\} & =[b-1] \backslash\left\{\|\mathrm{T}(u)\| \mid u \in\left[i-d^{\prime}\right], \mathrm{T}(u) \succeq \bar{n}\right\} \\
\left\{q_{1}<q_{2}<\cdots<q_{\nu}\right\} & =[b-1] \backslash\left\{\left\|\mathrm{T}_{3}(u)\right\| \mid u \in[i], \mathrm{T}_{3}(u) \succeq \bar{n}\right\} . \tag{119}
\end{align*}
$$

If $[b-1] \backslash\left\{\left\|\mathrm{T}_{3}(u)\right\| \mid u \in[i], \mathrm{T}_{3}(u) \succeq \bar{n}\right\}=\varnothing$, then $b \preceq \mathrm{~T}_{3}(u)$ for $u \in[i]$. In particular, we have $\mathrm{T}_{2}(1)=a \preceq b \preceq \mathrm{~T}_{3}\left(d^{\prime}\right)=\mathrm{T}_{4}\left(1+d^{\prime}\right)$ if $d^{\prime} \neq 0$, which is our claim. Therefore we may assume that $\nu \geqslant 1$. We see from ( $\frac{\infty}{2}$-D8) that $q_{1} \preceq \mathrm{~T}_{4}(1) \prec \mathrm{T}_{4}(2)=\mathrm{T}_{3}(1)$, which implies $q_{u} \prec \mathrm{~T}_{3}(u)$ for $u \in[\nu]$. In particular, we have $b \preceq \mathrm{~T}_{3}(u)$ for $u \in[\nu, i]$. If $d^{\prime} \in[\nu, i-1]$, then $\mathrm{T}_{2}(1)=a \preceq b \preceq \mathrm{~T}_{3}\left(d^{\prime}\right)=\mathrm{T}_{4}\left(1+d^{\prime}\right)$, which is our claim. Therefore we may assume that $\nu \geqslant 2$ and $d^{\prime} \in[0, \nu-1]$. Then $\left(q_{u} \prec \mathrm{~T}_{3}(u)\right.$ for $\left.u \in[\nu]\right)$ gives $\left(q_{u+1} \preceq \mathrm{~T}_{3}(u)\right.$ for $\left.u \in[\nu-1]\right)$. By minimality of $b$, we have $[b-1] \subset\{\|\mathbf{T}(u)\| \mid u \in[i]\}$. Hence there exists $l \in\left[0, d^{\prime}\right]$ such that

$$
\begin{equation*}
\left\{p_{1}<p_{2}<\cdots<p_{\mu}\right\}=\{\mathbf{T}(u) \mid u \in[\mu-l]\} \cup\{\|\mathbf{T}(u)\| \mid u \in[i-l+1, i]\} \tag{120}
\end{equation*}
$$

which implies $\mathbf{T}(u) \preceq p_{u+l}$ for $u \in[\mu-l]$. Since $l \leqslant d^{\prime}$, we have $\mathbf{T}(u) \preceq p_{u+d^{\prime}}$ for $u \in\left[\mu-d^{\prime}\right]$. Since $x \preceq x_{3}$, we have $\|\mathrm{T}(u)\| \geqslant\left\|\mathrm{T}_{3}\left(u+d^{\prime}\right)\right\|$ if $u \in\left[i-d^{\prime}\right]$ and $\mathrm{T}(u) \succeq \bar{n}$. Hence $\mu \geqslant \nu$ and $p_{u} \leqslant q_{u}$ for $u \in[\nu]$. Combining these gives
(121) $\mathbf{T}(u) \preceq p_{u+d^{\prime}} \preceq q_{u+d^{\prime}} \preceq \mathrm{T}_{3}\left(u+d^{\prime}-1\right)=\mathbf{T}_{4}\left(u+d^{\prime}\right)$ for $u \in\left[\nu-d^{\prime}\right]$ if $d^{\prime} \neq 0$.

In particular, $\mathrm{T}_{2}(1)=a \preceq \mathrm{~T}(1) \preceq \mathrm{T}_{4}\left(1+d^{\prime}\right)$ if $d^{\prime} \neq 0$, which is our claim. Similarly, we have

$$
\begin{equation*}
\mathrm{T}(u+1) \preceq \mathrm{T}_{3}(u) \text { for } u \in[\nu-1] \text { if } d^{\prime}=0 \tag{122}
\end{equation*}
$$

We next claim that $\mathrm{T}_{1}(u) \preceq \mathrm{T}_{3}\left(u+d^{\prime}\right)$ for $u \in\left[i-d^{\prime}-1\right]$. If $u \in\left[i-d^{\prime}-1\right]$ satisfies $\mathrm{T}_{1}(u)=\mathrm{T}(u)$, then $\mathrm{T}_{1}(u) \preceq \mathrm{T}_{3}\left(u+d^{\prime}\right)$ since $x \preceq x_{3}$. It remains to prove that $\mathrm{T}_{1}(u) \preceq \mathrm{T}_{3}\left(u+d^{\prime}\right)$ for $u \in[k] \cap\left[i-d^{\prime}-1\right]$ under the assumption that $a<b$, where $k \in[i]$ is as in Step 3. Recall that $b \preceq \mathrm{~T}_{3}(u)$ for $u \in[\max \{1, \nu\}, i]$. If $\nu \in[0,1]$, then $\mathrm{T}_{1}(u) \preceq b \preceq \mathrm{~T}_{3}\left(u+d^{\prime}\right)$ for $u \in[k] \cap\left[i-d^{\prime}-1\right]$. Therefore we may assume that $\nu \geqslant 2$. We first assume that $d^{\prime} \in[d-1]$. If $u \in[k-1] \cap\left[\nu-d^{\prime}\right]$, then $\mathrm{T}_{1}(u)=\mathrm{T}(u+1) \preceq \mathrm{T}_{3}\left(u+d^{\prime}\right)$ by (121). If $k \in\left[\nu-d^{\prime}-1\right]$, then $\mathrm{T}_{1}(k)=b \prec \mathrm{~T}(k+1) \preceq \mathrm{T}_{3}\left(k+d^{\prime}\right)$ by (121). If $k=\nu-d^{\prime}$, then $\mathrm{T}_{1}(k)=b \preceq \mathrm{~T}_{3}(\nu)=\mathrm{T}_{3}\left(k+d^{\prime}\right)$. If $u \in\left[\nu-d^{\prime}+1, k\right]$, then $\mathrm{T}_{1}(u) \preceq b \preceq \mathrm{~T}_{3}\left(u+d^{\prime}\right)$. We next assume that $d^{\prime}=0$. If $u \in[k-1] \cap[\nu-1]$, then $\mathrm{T}_{1}(u)=\mathrm{T}(u+1) \preceq \mathrm{T}_{3}(u)$ by (122). If $k \in[\nu-1]$, then $\mathrm{T}_{1}(k)=b \prec \mathrm{~T}(k+1) \preceq \mathrm{T}_{3}(k)$ by (122). If $u \in[\nu, k]$, then $\mathrm{T}_{1}(u) \preceq b \preceq \mathrm{~T}_{3}(u)$.

We finally claim that $\mathrm{T}_{2}(u) \preceq \mathrm{T}_{4}\left(u+d^{\prime}\right)$ for $u \in\left[2, i-d^{\prime}\right]$. Let $u \in\left[2, i-d^{\prime}\right]$; note that $u-1 \in\left[i-d^{\prime}-1\right]$. By the above, we have $\mathrm{T}_{2}(u)=\mathrm{T}_{1}(u-1) \preceq \mathrm{T}_{3}\left(u-1+d^{\prime}\right)=$ $\mathrm{T}_{4}\left(u+d^{\prime}\right)$.

The proof of Proposition 4.37 is complete.

## 5. TABLEAU MODEL FOR CRYSTAL BASES OF LEVEL-ZERO REPRESENTATIONS

In this section, we apply the results in $\S 4$ to crystal bases of level-zero representations of $\mathbf{U}$ of type $B_{n}^{(1)}, C_{n}^{(1)}$, and $D_{n}^{(1)}$. We introduce quantum Kashiwara-Nakashima columns (see Definitions 5.15 and 5.20 ) and semi-infinite Kashiwara-Nakashima tableaux (see Definitions 5.12, 5.17, and 5.22). We will see that these tableaux give combinatorial models for crystal bases of level-zero fundamental representations and level-zero extremal weight modules. When $\mathbf{U}$ is of type $B_{n}^{(1)}$ or $D_{n}^{(1)}$, we give an explicit description of the crystal isomorphisms among three different realizations of the crystal basis of a level-zero fundamental representation by quantum LakshmibaiSeshadri paths (see §5.1), quantum Kashiwara-Nakashima columns, and (ordinary) Kashiwara-Nakashima columns.
5.1. Quantum Lakshmibai-Seshadri paths. In this subsection, we give a brief exposition of quantum Lakshmibai-Seshadri paths (see [25] for details). Assume that $\mathbf{U}$ is of untwisted affine type.

Let $\lambda \in P^{+}$. Recall the notation $J_{\lambda}$ in (29). For a rational number $0<a \leqslant 1$, define $\mathrm{QB}(\lambda ; a)$ to be the subgraph of $\mathrm{QB}^{J_{\lambda}}$ with the same vertex set but having only the edges of the form

$$
\begin{equation*}
w \xrightarrow{\gamma} v \text { with } a\left\langle\gamma^{\vee}, \lambda\right\rangle \in \mathbb{Z} \tag{123}
\end{equation*}
$$

note that $\mathrm{QB}(\lambda ; 1)=\mathrm{QB}^{J_{\lambda}}$. A quantum Lakshmibai-Seshadri path of shape $\lambda$ is, by definition, a pair $(\boldsymbol{w} ; \boldsymbol{a})$ of a sequence $\boldsymbol{w}: w_{1}, w_{2}, \ldots, w_{l}$ of elements in $W^{J_{\lambda}}$ and an increasing sequence $\boldsymbol{a}: 0=a_{0}<a_{1}<\cdots<a_{l}=1$ of rational numbers such that there exists a directed path from $w_{u+1}$ to $w_{u}$ in $\operatorname{QB}\left(\lambda ; a_{u}\right)$ for $u \in[l-1]$. Let $\operatorname{QLS}(\lambda)$ denote the set of quantum Lakshmibai-Seshadri paths of shape $\lambda$. We call an element $(\boldsymbol{w} ; \boldsymbol{a}) \in \operatorname{QLS}(\lambda)$ a Lakshmibai-Seshadri path of shape $\lambda$ if there exists a directed path from $w_{u+1}$ to $w_{u}$ in $\operatorname{QB}\left(\lambda ; a_{u}\right)$ not having quantum edges for $u \in[l-1]$. Let $\operatorname{LS}(\lambda)$ denote the set of Lakshmibai-Seshadri paths of shape $\lambda$.

In the same manner as in $\S 2.5$ we can define maps wt $: \operatorname{QLS}(\lambda) \rightarrow P, e_{i}, f_{i}$ : $\operatorname{QLS}(\lambda) \rightarrow \operatorname{QLS}(\lambda) \sqcup\{\mathbf{0}\}$, and $\varepsilon_{i}, \varphi_{i}: \operatorname{QLS}(\lambda) \rightarrow \mathbb{Z}_{\geqslant 0}$ for $i \in I_{\mathrm{af}}$.

Theorem $5.1([12,15,27,25])$. Let $\lambda=\sum_{i \in I} m_{i} \varpi_{i} \in P^{+}$.
(1) The set $\operatorname{QLS}(\lambda)$ equipped with the maps $\mathrm{wt}, e_{i}, f_{i}, \varepsilon_{i}, \varphi_{i}, i \in I_{\mathrm{af}}$, is a $\mathbf{U}^{\prime}$ crystal. The $\mathbf{U}^{\prime}$-crystal $\operatorname{QLS}(\lambda)$ is isomorphic to the crystal basis of the tensor product $\bigotimes_{i \in I} W\left(\varpi_{i}\right)^{\otimes m_{i}}$ of level-zero fundamental representations (see §2.4).
(2) The set $\operatorname{LS}(\lambda)$ equipped with the maps $\mathrm{wt}, e_{i}, f_{i}, \varepsilon_{i}, \varphi_{i}, i \in I$, is a $\mathfrak{g}$-crystal. The $\mathfrak{g}$-crystal $\operatorname{LS}(\lambda)$ is isomorphic to the crystal basis of the integrable highest weight module of highest weight $\lambda$ over the quantized universal enveloping algebra associated with $\mathfrak{g}$.
5.2. Quantum Bruhat graphs and Maya diagrams. Throughout this subsection, we assume that $\mathbf{U}$ is of type $B_{n}^{(1)}, C_{n}^{(1)}$, or $D_{n}^{(1)}$. The aim of this subsection is to give descriptions of $\operatorname{QLS}\left(\varpi_{i}\right)$ and $\operatorname{LS}\left(\varpi_{i}\right)$ in terms of Maya diagrams.

Let $i \in I$. Note that $J_{\varpi_{i}}=I \backslash\{i\}$. We see from $c_{i}\left(\gamma^{\vee}\right)=\left\langle\gamma^{\vee}, \varpi_{i}\right\rangle \in\{0,1,2\}$ for $\gamma \in \Delta^{+}$that the graph $\mathrm{QB}\left(\varpi_{i} ; a\right)$ has at least one edge only if $a \in\{1 / 2,1\}$. Hence each element of $\operatorname{QLS}\left(\varpi_{i}\right)$ is of the form $(w ; 0,1)$ or $(v, w ; 0,1 / 2,1)$ for some $w, v \in W^{I \backslash\{i\}}$. For simplicity of notation, we write $(w, w)=(w ; 0,1)$ and $(v, w)=(v, w ; 0,1 / 2,1)$. The next lemma follows immediately from the results in $\S 4$ (see Propositions 4.17, 4.25-4.26, and 4.41-4.42).

Lemma 5.2. (1) If $\mathbf{U}$ is of type $C_{n}^{(1)}$, then $\operatorname{QLS}\left(\varpi_{i}\right)=\operatorname{LS}\left(\varpi_{i}\right)$.
(2) If $\left(\mathbf{U}\right.$ is of type $B_{n}^{(1)}$ and $\left.i=n\right)$, $\left(\mathbf{U}\right.$ is of type $C_{n}^{(1)}$ and $\left.i=1\right)$, or $(\mathbf{U}$ is of type $D_{n}^{(1)}$ and $\left.i \in\{1, n-1, n\}\right)$, then $w=v$ for all $(w, v) \in \operatorname{QLS}\left(\varpi_{i}\right)$, $\operatorname{QLS}\left(\varpi_{i}\right)=\operatorname{LS}\left(\varpi_{i}\right)$, and $W^{I \backslash\{i\}} \rightarrow \operatorname{QLS}\left(\varpi_{i}\right), w \mapsto(w ; 0,1)$, is bijective.
We say that $i \in I$ is minuscule if $\left\langle\gamma^{\vee}, \varpi_{i}\right\rangle \in\{0,1\}$ for all $\gamma \in \Delta^{+}$; we see that $i \in I$ is minuscule if and only if it satisfies the assumption of Lemma 5.2 (2).

Unless otherwise stated we assume that $i \in I$ is not minuscule. We call a subset $J \subset[n]$ a segment if there exist $j, k \in[n]$ such that $j \leqslant k$ and $J=[j, k]$. For segments $J=[j, k]$ and $J^{\prime}=\left[j^{\prime}, k^{\prime}\right]$, we write $J<J^{\prime}$ if $k+1<j^{\prime}$. Let $\mathcal{S}_{i}$ be the family of all sequences $\left(J_{1}<\cdots<J_{\mu}\right), \mu \geqslant 1$, of segments such that $\sum_{s=1}^{\mu} \# J_{s}=i$. It is easy to check that for $w \in W^{I \backslash\{i\}}$ there exists a unique $\mathcal{J}(w)=\left(J_{1}<\cdots<J_{\mu}\right) \in \mathcal{S}_{i}$ such that $\{\|w(u)\| \mid u \in[i]\}=J_{1} \sqcup \cdots \sqcup J_{\mu}$. For $\mathcal{J}=\left(J_{1}<\cdots<J_{\mu}\right) \in \mathcal{S}_{i}$, set $W^{I \backslash\{i\}}[\mathcal{J}]=\left\{w \in W^{I \backslash\{i\}} \mid \mathcal{J}(w)=\mathcal{J}\right\}$. It follows that

$$
\begin{equation*}
W^{I \backslash\{i\}}=\bigsqcup_{\mathcal{J} \in \mathcal{S}_{i}} W^{I \backslash\{i\}}[\mathcal{J}] . \tag{124}
\end{equation*}
$$

Let $2^{J_{\nu}}$ denote the power set of $J_{\nu}$ for $\nu \in[\mu]$. We call an element of $\prod_{\nu=1}^{\mu} 2^{J_{\nu}}$ a Maya diagram. We see that the next map is bijective.

$$
\begin{align*}
\mathcal{M}: W^{I \backslash\{i\}}[\mathcal{J}] & \rightarrow \prod_{\nu=1}^{\mu} 2^{J_{\nu}},  \tag{125}\\
w & \mapsto \mathcal{M}(w)=\left(J_{\nu} \cap\{\|w(u)\| \mid u \in[i], w(u) \succeq \bar{n}\}\right)_{\nu=1}^{\mu} .
\end{align*}
$$

The next lemma follows immediately from the results in §4 (see (b-C3), (b-B3), (b-B5), (q-B3), (b-D4) and (q-D2) in Propositions 4.17, 4.25-4.26, and 4.41-4.42).
Lemma 5.3. Assume that $i \in I$ is not minuscule. Let $w, v \in W^{I \backslash\{i\}}$. If $(v, w) \in$ $\operatorname{QLS}\left(\varpi_{i}\right)$, then $\mathcal{J}(w)=\mathcal{J}(v)$.

Let $\mathcal{J} \in \mathcal{S}_{i}$. Define $\mathrm{QB}\left(\varpi_{i} ; 1 / 2\right)[\mathcal{J}]$ to be the induced subgraph of $\mathrm{QB}\left(\varpi_{i} ; 1 / 2\right)$ with the vertex set $W^{I \backslash\{i\}}[\mathcal{J}]$. It follows from Lemma 5.3 that

$$
\begin{equation*}
\mathrm{QB}\left(\varpi_{i} ; 1 / 2\right)=\bigsqcup_{\mathcal{J} \in \mathcal{S}_{i}} \mathrm{QB}\left(\varpi_{i} ; 1 / 2\right)[\mathcal{J}] \tag{126}
\end{equation*}
$$

Let $J \subset[n]$ be a segment. We concern the following conditions for Maya diagrams $M, N \in 2^{J}$.
(M1) There exists $j \in[n-1]$ such that $j \in N, j+1 \in M$, and $M \backslash\{j+1\}=N \backslash\{j\}$.
(M2) $n \in N$ and $M=N \backslash\{n\}$.
(M3) $n-1, n \in N$ and $M=N \backslash\{n-1, n\}$.
(M4) $1,2 \in M$ and $N=M \backslash\{1,2\}$.
Definition 5.4. Assume that $i \in I$ is not minuscule. Let $J \subset[n]$ be a segment such that $\# J \leqslant i$. For $W$ of type $B_{n}, C_{n}$, or $D_{n}$, define $\mathrm{M}\left(\varpi_{i} ; 1 / 2\right)[J]$ to be the directed graph whose vertex set is $2^{J}$ and edges are given as follows. Let $M, N \in 2^{J}$.
(1) Assume that $W$ is of type $B_{n}$. There exists an edge $M \rightarrow N$ if (M1), (M2), or (M4) hold.
(2) Assume that $W$ is of type $C_{n}$. There exists an edge $M \rightarrow N$ if (M1) holds.
(3) Assume that $W$ is of type $D_{n}$. There exists an edge $M \rightarrow N$ if (M1), (M3), or (M4) hold.
Write $M \unlhd N$ if there exists a directed path from $M$ to $N$ in $\mathrm{M}\left(\varpi_{i} ; 1 / 2\right)[J]$. Write $M \unlhd^{\prime} N$ if there exists a directed path from $M$ to $N$ in $\mathrm{M}\left(\varpi_{i} ; 1 / 2\right)[J]$ not having edges of type (M4). We see that $\unlhd$ and $\unlhd^{\prime}$ define partial orders on $2^{J}$; note that if ( $W$ is of type $\left.C_{n}\right)$ or $(\{1,2\} \not \subset J)$, then $\unlhd$ is identical to $\unlhd^{\prime}$.

The next lemma is an easy consequence of the definition of partial orders $\unlhd$ and $\unlhd^{\prime}$ on $2^{J}$.

Lemma 5.5. Assume that $i \in I$ is not minuscule. Let $J \subset[n]$ be a segment such that $\# J \leqslant i$. Let $M, N \in 2^{J}$. Write $M=\left\{m_{1}<m_{2}<\cdots<m_{r}\right\}$ and $N=\left\{n_{1}<n_{2}<\right.$ $\left.\cdots<n_{s}\right\}$.
(1) Assume that ( $W$ is of type $C_{n}$ ), ( $W$ is of type $B_{n}, n \notin J$, and $\left.\{1,2\} \not \subset J\right)$, or ( $W$ is of type $D_{n}$ and $\{1,2\} \not \subset J$ ). We have $M \unlhd N$ if and only if $r=s$ and $m_{\nu} \geqslant n_{\nu}$ for $\nu \in[r]$.
(2) Assume that $W$ is of type $B_{n}$ and $n \in J$. We have $M \unlhd N$ if and only if $r \leqslant s$ and $m_{\nu} \geqslant n_{\nu}$ for $\nu \in[r]$.
(3) Assume that $W$ is of type $D_{n}$ and $n-1, n \in J$. We have $M \unlhd N$ if and only if $s-r \in 2 \mathbb{Z}_{\geqslant 0}$ and $m_{\nu} \geqslant n_{\nu}$ for $\nu \in[r]$.
(4) Assume that ( $W$ is of type $B_{n}, n \notin J$, and $\{1,2\} \subset J$ ) or ( $W$ is of type $D_{n}$, $n-1, n \notin J$, and $\{1,2\} \subset J)$. We have $M \unlhd N$ if and only if $r-s \in \mathbb{Z}_{\geqslant 0}$ and $m_{r-\nu} \geqslant n_{s-\nu}$ for $\nu \in[0, s-1]$. We have $M \unlhd^{\prime} N$ if and only if $r=s$ and $m_{\nu} \geqslant n_{\nu}$ for $\nu \in[r]$.
Definition 5.6. Assume that $i \in I$ is not minuscule. Let $\mathcal{J}=\left(J_{1}<\cdots<J_{\mu}\right) \in \mathcal{S}_{i}$. Define $\mathrm{M}\left(\varpi_{i} ; 1 / 2\right)[\mathcal{J}]$ to be the directed graph whose vertex set is $\prod_{\nu=1}^{\mu} 2^{J_{\nu}}$ and edges are given as follows: for $\left(M_{\nu}\right),\left(N_{\nu}\right) \in \prod_{\nu=1}^{\mu} 2^{J_{\nu}}$, set $\left(M_{\nu}\right) \rightarrow\left(N_{\nu}\right)$ if there exists $s \in[\mu]$ such that $M_{s} \rightarrow N_{s}$ in $\mathrm{M}\left(\varpi_{i} ; 1 / 2\right)\left[J_{s}\right]$ and $M_{t}=N_{t}$ for $t \in[\mu] \backslash\{s\}$. Set $\left(M_{\nu}\right) \unlhd\left(N_{\nu}\right)\left(\right.$ resp. $\left.\left(M_{\nu}\right) \unlhd^{\prime}\left(N_{\nu}\right)\right)$ if $M_{\nu} \unlhd N_{\nu}\left(\right.$ resp. $\left.M_{\nu} \unlhd^{\prime} N_{\nu}\right)$ for all $\nu \in[\mu]$.

The next lemma is an immediate consequence of (b-C3), (b-B3), (b-B5), (q-B3), (b-D4), and (q-D2) in Propositions 4.17, 4.25-4.26, and 4.41-4.42.

Lemma 5.7. Assume that $i \in I$ is not minuscule. Let $\mathcal{J}=\left(J_{1}<\cdots<J_{\mu}\right) \in \mathcal{S}_{i}$. The map (125) induces an isomorphism

$$
\begin{equation*}
\mathrm{QB}\left(\varpi_{i} ; 1 / 2\right)[\mathcal{J}] \stackrel{\cong}{\cong} \mathrm{M}\left(\varpi_{i} ; 1 / 2\right)[\mathcal{J}] \tag{127}
\end{equation*}
$$

of directed graphs.
We see that an edge in $\mathrm{M}\left(\varpi_{i} ; 1 / 2\right)[\mathcal{J}]$ of type (M1)-(M3) (resp. (M4)) corresponds to a Bruhat edge (resp. a quantum edge) in $\mathrm{QB}^{I \backslash\{i\}}$. By Lemma 5.7, we can define a partial order $\unlhd\left(\right.$ resp. $\left.\unlhd^{\prime}\right)$ on $W^{I \backslash\{i\}}$ as follows. Let $w, v \in W^{I \backslash\{i\}}$. If $\mathcal{J}(w) \neq \mathcal{J}(v)$,
then $w$ and $v$ are incomparable to each other. Assume that $\mathcal{J}(w)=\mathcal{J}(v)$. Recall the $\operatorname{map} \mathcal{M}$ in $(125)$. Set $w \unlhd v\left(\right.$ resp. $\left.w \unlhd^{\prime} v\right)$ if $\mathcal{M}(w) \unlhd \mathcal{M}(v)\left(\right.$ resp. $\left.\mathcal{M}(w) \unlhd^{\prime} \mathcal{M}(v)\right)$. We have thus proved that

$$
\begin{align*}
\operatorname{QLS}\left(\varpi_{i}\right) & =\left\{(v, w) \mid w, v \in W^{I \backslash\{i\}}, w \unlhd v\right\},  \tag{128}\\
\operatorname{LS}\left(\varpi_{i}\right) & =\left\{(v, w) \mid w, v \in W^{I \backslash\{i\}}, w \unlhd^{\prime} v\right\} . \tag{129}
\end{align*}
$$

From now on, we freely identify $w, \mathbf{T}_{w}^{(i)}$, and $\mathcal{M}(w)$ with each other for $w \in W^{I \backslash\{i\}}$.
For $(v, w) \in \operatorname{QLS}\left(\varpi_{i}\right)$, let $d_{i}(v, w) \in \mathbb{Z}_{\geqslant 0}$ be the number of edges of type (M4) in a directed path from $w$ to $v$ in $\mathrm{QB}\left(\varpi_{i} ; 1 / 2\right)$; for convenience we define $d_{i}(v, w)=0$ for $(v, w) \in \operatorname{QLS}\left(\varpi_{i}\right)$ if $i \in I$ is minuscule. We see from the next lemma that $d_{i}(v, w)$ is independent of the choice of a directed path from $w$ to $v$ in $\mathrm{QB}\left(\varpi_{i} ; 1 / 2\right)$.

Lemma 5.8. Assume that $i \in I$ is not minuscule. Let $(v, w) \in \operatorname{QLS}\left(\varpi_{i}\right)$; we see from Lemma 5.3 that $\mathcal{J}(w)=\mathcal{J}(v)$. Write $\mathcal{J}(w)=\mathcal{J}(v)=\left(J_{1}<\cdots<J_{\mu}\right), r=\#\{u \in$ $\left.[i] \mid\|w(u)\| \in J_{1}, w(u) \succeq \bar{n}\right\}$, and $s=\#\left\{u \in[i] \mid\|v(u)\| \in J_{1}, v(u) \succeq \bar{n}\right\}$; note that if $\mathcal{M}(w)=\left(M_{\nu}\right)$ and $\mathcal{M}(v)=\left(N_{\nu}\right)$, then $r=\# M_{1}$ and $s=\# N_{1}$. If $\left(W\right.$ is of type $\left.C_{n}\right)$ or $\left(\{1,2\} \not \subset J_{1}\right)$, then $d_{i}(v, w)=0$. If $\left(W\right.$ is of type $B_{n}$ or $\left.D_{n}\right)$ and $\left(\{1,2\} \subset J_{1}\right)$, then $d_{i}(v, w)=(r-s) / 2$.

Proof. The assertion follows from Lemma 5.5 (4).
Let $\operatorname{QLS}\left(\varpi_{i}\right)_{\text {af }}=\operatorname{QLS}\left(\varpi_{i}\right) \times \mathbb{Z}$ be the affinization of the $\mathbf{U}^{\prime}$-crystal $\operatorname{QLS}\left(\varpi_{i}\right)$ (see $\S 2.2)$; we have $\mathrm{wt}((v, w), c)=(1 / 2)\left(v \varpi_{i}+w \varpi_{i}\right)-c \delta \in P_{\mathrm{af}}$ for $(v, w) \in \operatorname{QLS}\left(\varpi_{i}\right)$ and $c \in \mathbb{Z}$. The next lemma holds for all $i \in I$.

Lemma 5.9. Let $i \in I$ and $m \in \mathbb{Z}_{\geqslant 0}$.
(1) We have an isomorphism

$$
\begin{align*}
\operatorname{QLS}\left(\varpi_{i}\right)_{\mathrm{af}} & \rightarrow \mathbb{B}^{\frac{\infty}{2}}\left(\varpi_{i}\right), \\
((v, w), c) & \mapsto\left(v T_{\left(c+d_{i}(v, w)\right) \alpha_{i}^{\vee}}^{I \backslash\{i\}}, w T_{\left(c-d_{i}(v, w)\right) \alpha_{i}^{\vee}}^{I \backslash\{i\}} ; 0, \frac{1}{2}, 1\right) \tag{130}
\end{align*}
$$

of $\mathbf{U}$-crystals, where $w, v \in W^{I \backslash\{i\}}$ and $c \in \mathbb{Z}$; we understand that $(x, x ; 0,1 / 2,1)=(x ; 0,1)$ for $x \in\left(W^{I \backslash\{i\}}\right)_{\mathrm{af}}$.
(2) The crystal basis $\mathcal{B}\left(m \varpi_{i}\right)$ is isomorphic to the subcrystal of $\mathrm{QLS}\left(\varpi_{i}\right)_{\mathrm{af}}^{\otimes m}$ consisting of the elements $\bigotimes_{\nu=1}^{m}\left(\left(v_{\nu}, w_{\nu}\right), c_{\nu}\right)$ such that

$$
\begin{equation*}
w_{\nu} T_{\left(c_{\nu}-d_{i}\left(v_{\nu}, w_{\nu}\right)\right) \alpha_{i}^{\vee}}^{I \backslash\left\{v_{\nu+1} T_{\left(c_{\nu+1}+d_{i}\left(v_{\nu+1}, w_{\nu+1}\right)\right) \alpha_{i}^{\vee}}^{I \backslash\{i\}} \text { in }\left(W^{I \backslash\{i\}}\right)_{\mathrm{af}}, ~\right.} \tag{131}
\end{equation*}
$$

for $\nu \in[m-1]$.
Proof. (1): If $i \in I$ is minuscule, then the proof is straightforward (see also Remark 5.10 below).

Assume that $i \in I$ is not minuscule. By Lemmas 4.3 and $5.5-5.8$, we check at once that the map (130) is well-defined, and is an isomorphism of $\mathbf{U}$-crystals.
(2): The assertion follows from (1) and [10, Theorem 3.4].

Remark 5.10. Let $i \in I$. By Theorem 5.1 (1) and [16, Theorem 5.17 (vii)-(viii)], we have a unique isomorphism $\operatorname{QLS}\left(\varpi_{i}\right)_{\mathrm{af}} \cong \mathcal{B}\left(\varpi_{i}\right)$ of U-crystals. By Theorem 2.9 (2), we have a unique isomorphism $\mathcal{B}\left(\varpi_{i}\right) \cong \mathbb{B}^{\frac{\infty}{2}}\left(\varpi_{i}\right)$ of U-crystals. The map (130) equals the composition of these isomorphisms.
5.3. Type $C_{n}^{(1)}$. Throughout this subsection, we assume that $\mathfrak{g}$ and $W$ are of type $C_{n}$. Recall that $I=[n], \Delta=\left\{ \pm\left(\varepsilon_{s} \pm \varepsilon_{t}\right) \mid s, t \in[n], s<t\right\} \sqcup\left\{ \pm 2 \varepsilon_{s} \mid s \in[n]\right\}$, and $\Pi=\left\{\alpha_{s}=\varepsilon_{s}-\varepsilon_{s+1} \mid s \in[n-1]\right\} \sqcup\left\{\alpha_{n}=2 \varepsilon_{n}\right\}$. The highest root is $\theta=2 \varepsilon_{1}=$ $2 \alpha_{1}+\cdots+2 \alpha_{n-1}+\alpha_{n}$; we have $\theta^{\vee}=\varepsilon_{1}$. We identify $\varpi_{i}$ with $\varepsilon_{1}+\varepsilon_{2}+\cdots+\varepsilon_{i}$ for $i \in I$.

Let $i \in[n]$. A map C : $[i] \rightarrow \mathcal{C}_{n}$ is, by definition, a Kashiwara-Nakashima $C_{n^{-}}$ column (KN $C_{n}$-column for short) of shape $\varpi_{i}$ if
(KN-C1) C $(1) \prec \mathrm{C}(2) \prec \cdots \prec \mathrm{C}(i)$,
(KN-C2) if $t=\mathrm{C}(p)=\sigma(\mathrm{C}(q)) \in[n]$ for some $p, q \in[i]$, then $q-p>i-t$.
Let $\mathrm{KN}_{C_{n}}\left(\varpi_{i}\right)$ be the set of KN $C_{n}$-columns of shape $\varpi_{i}$. We sometimes identify $\mathrm{C} \in \mathrm{KN}_{C_{n}}\left(\varpi_{i}\right)$ with its image $\{\mathrm{C}(u) \mid u \in[i]\} \subset \mathcal{C}_{n}$.

Let $\mathrm{C}:[i] \rightarrow \mathcal{C}_{n}$ be a map satisfying (KN-C1). Let $I_{\mathrm{C}}=\left\{z_{1} \succ z_{2} \succ \cdots \succ z_{k}\right\}$ be the set of $z \in \mathcal{C}_{n}$ such that $z \preceq n$ and $\{z, \bar{z}\} \subset C$. We say that $C$ can be split if there exists a subset $J_{\mathrm{C}}=\left\{y_{1}>y_{2}>\cdots>y_{k}\right\} \subset[n]$ such that
(i) $y_{1}=\max \left\{y \in \mathcal{C}_{n} \mid y \prec z_{1}, y \notin \mathrm{C}, \bar{y} \notin \mathrm{C}\right\}$,
(ii) $y_{\nu}=\max \left\{y \in \mathcal{C}_{n} \mid y \prec \min \left\{y_{\nu-1}, z_{\nu}\right\}, y \notin \mathrm{C}, \bar{y} \notin \mathrm{C}\right\}$ for $\nu \in[2, k]$.

Define $r \mathrm{C}, l \mathrm{C} \in \operatorname{CST}_{C_{n}}\left(\varpi_{i}\right)$ to be such that $r \mathrm{C}=\left(\mathrm{C} \backslash\left\{\bar{z} \mid z \in I_{\mathrm{C}}\right\}\right) \cup\left\{\bar{y} \mid y \in J_{\mathrm{C}}\right\}$ and $l \mathrm{C}=\left(\mathrm{C} \backslash I_{\mathrm{C}}\right) \cup J_{\mathrm{C}}$.

Define a $\mathfrak{g}$-crystal structure on $\mathrm{KN}_{C_{n}}\left(\varpi_{i}\right)$ as follows (cf. [18, §4]). Let $\mathrm{C} \in$ $\mathrm{KN}_{C_{n}}\left(\varpi_{i}\right)$. If we set $\varepsilon_{\bar{s}}=-\varepsilon_{s}$ for $s \in[n]$, then the weight of C is

$$
\begin{equation*}
\mathrm{wt}(\mathrm{C})=\sum_{u \in[i]} \varepsilon_{\mathrm{C}(u)} . \tag{132}
\end{equation*}
$$

Let $j \in I$. Note that only the letters $j, j+1, \overline{j+1}, \bar{j}$ may be changed in C when we apply $e_{j}$ or $f_{j}$. Moreover, the actions of $e_{j}$ and $f_{j}$ are uniquely determined from $\mathrm{C} \cap\{j, j+1, \overline{j+1}, \bar{j}\}$. Hence, by omitting the letters not being in $\{j, j+1, \overline{j+1}, \bar{j}\}$, we can illustrate the actions of $f_{j}$ for $j \in[n-1]$ by

set $f_{j} \mathrm{C}=\mathbf{0}$ otherwise. Similarly, the action of $f_{n}$ is illustrated by

set $f_{n} \mathrm{C}=\mathbf{0}$ otherwise. The maps $e_{j}, j \in I$, are defined to be such that the condition (C6) in $\S 2.2$ holds. For $\mathrm{C} \in \mathrm{KN}_{C_{n}}\left(\varpi_{i}\right)$ and $j \in I$, set $\varepsilon_{j}(\mathrm{C})=\max \left\{k \in \mathbb{Z}_{\geqslant 0} \mid e_{j}^{k} \mathrm{C} \neq \mathbf{0}\right\}$ and $\varphi_{j}(\mathrm{C})=\max \left\{k \in \mathbb{Z}_{\geqslant 0} \mid f_{j}^{k} \mathrm{C} \neq \mathbf{0}\right\}$.

The next lemma is a reformulation of [34, Theorem A.1] in terms of Maya diagrams.
Lemma 5.11. Assume that $\mathfrak{g}$ and $W$ are of type $C_{n}$. For a map $\mathrm{C}:[i] \rightarrow \mathcal{C}_{n}$ satisfying (KN-C1), we have $\mathrm{C} \in \mathrm{KN}_{C_{n}}\left(\varpi_{i}\right)$ if and only if C can be split. The map

$$
\begin{equation*}
\mathrm{KN}_{C_{n}}\left(\varpi_{i}\right) \rightarrow \mathrm{LS}\left(\varpi_{i}\right), \mathrm{C} \mapsto(r \mathrm{C}, l \mathrm{C}), \tag{138}
\end{equation*}
$$

is an isomorphism of $\mathfrak{g}$-crystals. The inverse of (138) is given as follows. Let $(v, w) \in$ $\mathrm{LS}\left(\varpi_{i}\right), \mathcal{J}(w)=\mathcal{J}(v)=\left(J_{1}<\cdots<J_{\mu}\right) \in \mathcal{S}_{i}$ and $\mathcal{M}(w)=\left(M_{\nu}\right), \mathcal{M}(v)=\left(N_{\nu}\right) \in$ $\prod_{\nu=1}^{\mu} 2^{J_{\nu}}$. The inverse image of $(v, w)$ is

$$
\begin{align*}
\mathrm{C} & =\{v(u) \mid u \in[i], v(u) \preceq n\} \cup\{w(u) \mid u \in[i], w(u) \succeq \bar{n}\} \\
& =\bigcup_{\nu=1}^{\mu}\left(\left(J_{\nu} \backslash N_{\nu}\right) \cup\left\{\bar{z} \mid z \in M_{\nu}\right\}\right) \tag{139}
\end{align*}
$$

we have $I_{\mathrm{C}}=\bigcup_{\nu=1}^{\mu}\left(M_{\nu} \backslash N_{\nu}\right)$ and $J_{\mathrm{C}}=\bigcup_{\nu=1}^{\mu}\left(N_{\nu} \backslash M_{\nu}\right)$.
By Lemma $5.2(1)$, we have $\operatorname{QLS}\left(\varpi_{i}\right)=\operatorname{LS}\left(\varpi_{i}\right) \cong \mathrm{KN}_{C_{n}}\left(\varpi_{i}\right)$. Hence $\mathrm{KN}_{C_{n}}\left(\varpi_{i}\right)$ inherits a $\mathbf{U}^{\prime}$-crystal structure from $\operatorname{QLS}\left(\varpi_{i}\right)$. We see that only the letters $1, \overline{1}$ may be changed in $C$ when we apply $e_{0}$ or $f_{0}$, and the actions of $e_{0}$ and $f_{0}$ are uniquely determined from $\mathrm{C} \cap\{1, \overline{1}\}$. The action of $f_{0}$ is illustrated by

set $f_{0} \mathrm{C}=\mathbf{0}$ otherwise. The map $e_{0}$ is defined to be such that the condition (C6) in $\S 2.2$ holds.

For a tuple $\left(\mathrm{C}_{1}, \mathrm{C}_{2}, \ldots, \mathrm{C}_{m}\right)$ of columns, let $\mathrm{C}_{1} \mathrm{C}_{2} \cdots \mathrm{C}_{m}$ denote the tableau whose $\nu$-th column is $\mathrm{C}_{\nu}$. Recall the partial order $\preceq$ on $\mathrm{CST}_{C_{n}}\left(\varpi_{i}\right) \times \mathbb{Z}$ (see Definition 4.12).

Definition 5.12. Let $i \in I$ and $m \in \mathbb{Z}_{\geqslant 0}$.
(1) Let $\mathbb{T}=\left(\mathrm{T}_{1} \mathrm{~T}_{2} \cdots \mathrm{~T}_{m},\left(c_{1}, c_{2}, \ldots, c_{m}\right)\right)$, where $\mathrm{T}_{\nu} \in \mathrm{KN}_{C_{n}}\left(\varpi_{1}\right)=\operatorname{CST}_{C_{n}}\left(\varpi_{1}\right)$ and $c_{\nu} \in \mathbb{Z}$ for $\nu \in[m]$. We call $\mathbb{T}$ a semi-infinite $K N C_{n}$-tableau of shape $m \varpi_{1}$ if

$$
\begin{equation*}
\left(\mathrm{T}_{\nu}, c_{\nu}\right) \succeq\left(\mathrm{T}_{\nu+1}, c_{\nu+1}\right) \tag{141}
\end{equation*}
$$

in $\operatorname{CST}_{C_{n}}\left(\varpi_{1}\right) \times \mathbb{Z}$ for $\nu \in[m-1]$.
(2) Assume that $i \in[2, n]$. Let $\mathbb{T}=\left(\mathrm{C}_{1} \mathrm{C}_{2} \cdots \mathrm{C}_{m},\left(c_{1}, c_{2}, \ldots, c_{m}\right)\right)$, where $\mathrm{C}_{\nu} \in$ $\mathrm{KN}_{C_{n}}\left(\varpi_{i}\right)$ and $c_{\nu} \in \mathbb{Z}$ for $\nu \in[m]$. We call $\mathbb{T}$ a semi-infinite $K N C_{n}$-tableau of shape $m \varpi_{i}$ if

$$
\begin{equation*}
\left(l \mathrm{C}_{\nu}, c_{\nu}\right) \succeq\left(r \mathrm{C}_{\nu+1}, c_{\nu+1}\right) \tag{142}
\end{equation*}
$$

in $\operatorname{CST}_{C_{n}}\left(\varpi_{i}\right) \times \mathbb{Z}$ for $\nu \in[m-1]$.
Let $\mathbb{Y}_{C_{n}}^{\frac{\infty}{2}}\left(m \varpi_{i}\right)$ be the set of semi-infinite $K N C_{n}$-tableaux of shape $m^{i}{ }_{i}$. For $\lambda=$ $\sum_{i \in I} m_{i} \varpi_{i} \in P^{+}$, set $\mathbb{Y}_{C_{n}}^{\frac{\infty}{2}}(\lambda)=\prod_{i \in I} \mathbb{Y}_{C_{n}}^{\frac{\infty}{2}}\left(m_{i} \varpi_{i}\right)$. We call an element of $\mathbb{Y}_{C_{n}}^{\frac{\infty}{2}}(\lambda) a$ semi-infinite $K N C_{n}$-tableau of shape $\lambda$.

Let $\mathrm{KN}_{C_{n}}\left(\varpi_{i}\right)_{\text {af }}$ denote the affinization of the $\mathbf{U}^{\prime}$-crystal $\mathrm{KN}_{C_{n}}\left(\varpi_{i}\right)$ (see §2.2). Combining Theorem 2.8, Proposition 4.13 (2), Lemma 5.9, and Definition 5.12 we obtain the following theorem; note that $d_{i}(v, w)=0$ for all $i \in I$ and $(v, w) \in$ QLS $\left(\varpi_{i}\right)$, by Lemma 5.8.

Theorem 5.13. Assume that $\mathbf{U}$ is of type $C_{n}^{(1)}$. Let $\lambda=\sum_{i \in I} m_{i} \varpi_{i} \in P^{+}$. For each $i \in I$, the image of the map

$$
\begin{align*}
& \mathbb{Y}_{C_{n}}^{\frac{\infty}{2}}\left(m_{i} \varpi_{i}\right) \rightarrow \mathrm{KN}_{C_{n}}\left(\varpi_{i}\right)_{\mathrm{af}}^{\otimes m_{i}}, \\
& \left(\mathrm{C}_{1} \mathrm{C}_{2} \cdots \mathrm{C}_{m_{i}},\left(c_{1}, c_{2}, \ldots, c_{m_{i}}\right)\right) \mapsto \bigotimes_{\nu \in\left[m_{i}\right]}\left(\mathrm{C}_{\nu}, c_{\nu}\right), \tag{143}
\end{align*}
$$

is a $\mathbf{U}$-subcrystal. Hence we can define a $\mathbf{U}$-crystal structure on $\mathbb{Y}_{C_{n}}^{\frac{\infty}{C_{n}}}\left(m_{i} \varpi_{i}\right)$ to be such that the map (143) is a strict embedding of $\mathbf{U}$-crystals. In particular, $\mathbb{Y}_{C_{n}}^{\frac{\infty}{2}}(\lambda)$ is a U-subcrystal of $\bigotimes_{i \in I} \mathrm{KN}_{C_{n}}\left(\varpi_{i}\right)_{\mathrm{af}}^{\otimes m_{i}}$. Then $\mathbb{Y}_{C_{n}}^{\frac{\infty}{2}}(\lambda)$ is isomorphic, as a $\mathbf{U}$-crystal, to the crystal basis $\mathcal{B}(\lambda)$.
5.4. Type $B_{n}^{(1)}$. Throughout this subsection, we assume that $\mathfrak{g}$ and $W$ are of type $B_{n}$. Recall that $I=[n], \Delta=\left\{ \pm\left(\varepsilon_{s} \pm \varepsilon_{t}\right) \mid s, t \in[n], s<t\right\} \sqcup\left\{ \pm \varepsilon_{s} \mid s \in[n]\right\}$, and $\Pi=\left\{\alpha_{s}=\varepsilon_{s}-\varepsilon_{s+1} \mid s \in[n-1]\right\} \sqcup\left\{\alpha_{n}=\varepsilon_{n}\right\}$. The highest root is $\theta=\varepsilon_{1}+\varepsilon_{2}=$ $\alpha_{1}+2 \alpha_{2}+\cdots+2 \alpha_{n}$; we have $\theta^{\vee}=\theta$. We identify $\varpi_{i}$ with $\varepsilon_{1}+\varepsilon_{2}+\cdots+\varepsilon_{i}$ if $i \in[n-1]$, and with $\frac{1}{2}\left(\varepsilon_{1}+\varepsilon_{2}+\cdots+\varepsilon_{n}\right)$ if $i=n$.

Set

$$
\begin{equation*}
\mathcal{B}_{n}=\{1 \prec 2 \prec \cdots \prec n \prec 0 \prec \bar{n} \prec \cdots \prec \overline{2} \prec \overline{1}\} . \tag{144}
\end{equation*}
$$

Define $\sigma: \mathcal{B}_{n} \rightarrow \mathcal{B}_{n}$ by $\sigma(0)=0, \sigma(u)=\bar{u}$, and $\sigma(\bar{u})=u$ for $u \in[n]$.
Let $i \in[n-1]$. A map $C:[i] \rightarrow \mathcal{B}_{n}$ is, by definition, a Kashiwara-Nakashima $B_{n}$-column (KN $B_{n}$-column for short) of shape $\varpi_{i}$ if
(KN-B1) C $(1) \preceq \mathrm{C}(2) \preceq \cdots \preceq \mathrm{C}(i)$,
(KN-B2) if $0 \prec \mathrm{C}(u)$ or $\mathrm{C}(u+1) \prec 0$, then $\mathrm{C}(u) \prec \mathrm{C}(u+1)$ for $u \in[i-1]$,
(KN-B3) if $t=\mathrm{C}(p)=\sigma(\mathrm{C}(q)) \in[n]$ for some $p, q \in[i]$, then $q-p>i-t$;
note that $0 \in \mathcal{B}_{n}$ is the unique element that may appear in $C$ more than once. Let $\mathrm{KN}_{B_{n}}\left(\varpi_{i}\right)$ be the set of KN $B_{n}$-columns of shape $\varpi_{i}$. We sometimes identify $\mathrm{C} \in \mathrm{KN}_{B_{n}}\left(\varpi_{i}\right)$ with the multiset $\{\mathrm{C}(u) \mid u \in[i]\}$. For convenience we also denote by $\operatorname{KN}_{B_{n}}\left(\varpi_{n}\right)=\operatorname{CST}_{B_{n}}\left(\varpi_{n}\right)$.

Let $i \in[n-1]$. Let $\mathrm{C}:[i] \rightarrow \mathcal{B}_{n}$ be a map satisfying (KN-B1)-(KN-B2). Let $I_{\mathrm{C}}=\left\{z_{1} \succeq z_{2} \succeq \cdots \succeq z_{k}\right\}$ be the multiset of $z \in \mathrm{C}$ such that $z \preceq 0$ and $\{z, \sigma(z)\} \subset \mathrm{C}$; note that $\{\mathrm{C}(u) \mid u \in[i], \mathrm{C}(u)=0\}$ is a multisubset of $I_{\mathrm{C}}$. We say that C can be split if there exists a subset $J_{\mathrm{C}}=\left\{y_{1}>y_{2}>\cdots>y_{k}\right\} \subset[n]$ such that
(i) $y_{1}=\max \left\{y \in \mathcal{B}_{n} \mid y \prec z_{1}, y \notin \mathrm{C}, \bar{y} \notin \mathrm{C}\right\}$,
(ii) $y_{\nu}=\max \left\{y \in \mathcal{B}_{n} \mid y \prec \min \left\{y_{\nu-1}, z_{\nu}\right\}, y \notin \mathrm{C}, \bar{y} \notin \mathrm{C}\right\}$ for $\nu \in[2, k]$.

Define $r \mathrm{C}, l \mathrm{C} \in \mathrm{CST}_{B_{n}}\left(\varpi_{i}\right)$ to be such that $r \mathrm{C}=\left(\mathrm{C} \backslash\left\{\sigma(z) \mid z \in I_{\mathrm{C}}\right\}\right) \cup\left\{\sigma(y) \mid y \in J_{\mathrm{C}}\right\}$ and $l \mathrm{C}=\left(\mathrm{C} \backslash I_{\mathrm{C}}\right) \cup J_{\mathrm{C}}$.

Define a $\mathfrak{g}$-crystal structure on $\mathrm{KN}_{B_{n}}\left(\varpi_{i}\right)$ for $i \in[n-1]$ as follows (cf. [18, §5]); for the definition of a $\mathfrak{g}$-crystal structure on $\mathrm{KN}_{B_{n}}\left(\varpi_{n}\right)$ we refer the reader to [21, §2.3]. The maps wt, $\varepsilon_{j}, \varphi_{j}$ for $j \in I$ and $e_{j}, f_{j}$ for $j \in[n-1]$ are defined in the same manner as those for $\mathrm{KN}_{C_{n}}\left(\varpi_{i}\right)$. Note that only the letters $n, 0, \bar{n}$ may be changed in C when we apply $e_{n}$ or $f_{n}$. Moreover, the actions of $e_{n}$ and $f_{n}$ are uniquely determined from
the multiset $\{\mathrm{C}(u) \mid u \in[i], \mathrm{C}(u) \in\{n, 0, \bar{n}\}\}$. The action of $f_{n}$ is illustrated by

set $f_{n} \mathrm{C}=\mathbf{0}$ otherwise. The map $e_{n}$ is defined to be such that the condition (C6) in § 2.2 holds.

The next lemma is a reformulation of [21, Corollary 3.1.11 and Remark 3.1.13] in terms of Maya diagrams.

Lemma 5.14. Assume that $\mathfrak{g}$ and $W$ are of type $B_{n}$.
(1) The map $\mathrm{LS}\left(\varpi_{n}\right) \rightarrow \mathrm{KN}_{B_{n}}\left(\varpi_{n}\right)=\operatorname{CST}_{B_{n}}\left(\varpi_{n}\right),(w ; 0,1) \mapsto \mathrm{T}_{w}^{(n)}$, is an isomorphism of $\mathfrak{g}$-crystals.
(2) Assume that $i \in[n-1]$. For a map $\mathrm{C}:[i] \rightarrow \mathcal{B}_{n}$ satisfying (KN-B1)-(KN-B2), we have $\mathrm{C} \in \mathrm{KN}_{B_{n}}\left(\varpi_{i}\right)$ if and only if C can be split. The map

$$
\begin{equation*}
\mathrm{KN}_{B_{n}}\left(\varpi_{i}\right) \rightarrow \mathrm{LS}\left(\varpi_{i}\right), \mathrm{C} \mapsto(r \mathrm{C}, l \mathrm{C}) \tag{146}
\end{equation*}
$$

is an isomorphism of $\mathfrak{g}$-crystals. The inverse of (146) is given as follows. Let $(v, w) \in \operatorname{LS}\left(\varpi_{i}\right), \mathcal{J}(w)=\mathcal{J}(v)=\left(J_{1}<\cdots<J_{\mu}\right) \in \mathcal{S}_{i}, \mathcal{M}(w)=$ $\left(M_{\nu}\right), \mathcal{M}(v)=\left(N_{\nu}\right) \in \prod_{\nu=1}^{\mu} 2^{J_{\nu}}$, and $f=\# N_{\mu}-\# M_{\mu} \in \mathbb{Z}_{\geqslant 0}$. The inverse image of $(v, w)$ is

$$
\begin{aligned}
& \begin{array}{l}
\mathrm{C}=\{v(u) \mid u \in[i], v(u) \preceq n\} \cup\{w(u) \mid u \in[i], w(u) \succeq \bar{n}\} \cup\{\underbrace{0,0, \ldots, 0}_{f \text { times }}\} \\
\\
\quad=\bigcup_{\nu=1}^{\mu}\left(\left(J_{\nu} \backslash N_{\nu}\right) \cup\left\{\bar{z} \mid z \in M_{\nu}\right\}\right) \cup\{\underbrace{0,0, \ldots, 0}_{f \text { times }}\} ;
\end{array} \\
& \text { we have } I_{\mathrm{C}}=\bigcup_{\nu=1}^{\mu}\left(M_{\nu} \backslash N_{\nu}\right) \cup\{\underbrace{0,0, \ldots, 0}_{f \text { times }}\} \text { and } J_{\mathrm{C}}=\bigcup_{\nu=1}^{\mu}\left(N_{\nu} \backslash M_{\nu}\right) .
\end{aligned}
$$

Set

$$
\begin{equation*}
\tilde{\mathcal{B}}_{n}=\mathcal{B}_{n} \cup\{\overline{0}\}=\{1 \prec 2 \prec \cdots \prec n \prec 0 \prec \bar{n} \prec \cdots \prec \overline{2} \prec \overline{1} \prec \overline{0}\} . \tag{148}
\end{equation*}
$$

Definition 5.15. Let $i \in[n-1]$. A map $\tilde{C}:[i] \rightarrow \tilde{\mathcal{B}}_{n}$ is, by definition, a quantum
Kashiwara-Nakashima $B_{n}$-column (QKN $B_{n}$-column for short) of shape $\varpi_{i}$ if
(QKN-B1) there exists $m \in \mathbb{Z}_{\geqslant 0}$ such that $2 m \leqslant i$ and

$$
\begin{align*}
\tilde{\mathrm{C}}(1) & \preceq \tilde{\mathrm{C}}(2) \preceq \cdots \preceq \tilde{\mathrm{C}}(i-2 m) \\
& \prec \overline{0}=\tilde{\mathrm{C}}(i-2 m+1)=\cdots=\tilde{\mathrm{C}}(i-1)=\tilde{\mathrm{C}}(i), \tag{149}
\end{align*}
$$

(QKN-B2) the map $\mathrm{C}:[i-2 m] \rightarrow \mathcal{B}_{n}, u \mapsto \tilde{\mathrm{C}}(u)$, is a KN $B_{n}$-column of shape $\varpi_{i-2 m}$; in this case, we write $\tilde{\mathrm{C}}=\mathrm{C} \cup\{\underbrace{\overline{0}, \overline{0}, \ldots, \overline{0}}_{2 m \text { times }}\}$ for brevity. Let $\mathrm{QKN}_{B_{n}}\left(\varpi_{i}\right)$ be the set of QKN $B_{n}$-columns of shape $\varpi_{i}$. We sometimes identify $\tilde{\mathrm{C}} \in \mathrm{QKN}_{B_{n}}\left(\varpi_{i}\right)$ with the multiset $\{\tilde{\mathrm{C}}(u) \mid u \in[i]\}$. For convenience we also denote by $\operatorname{QKN}_{B_{n}}\left(\varpi_{n}\right)=\operatorname{CST}_{B_{n}}\left(\varpi_{n}\right)$.

Let $i \in[n-1]$. Let $\tilde{\mathrm{C}} \in \operatorname{QKN}_{B_{n}}\left(\varpi_{i}\right)$, and let $\mathrm{C} \in \mathrm{KN}_{B_{n}}\left(\varpi_{i-2 m}\right)$ be as in (QKNB2). Write $\left\{x_{1}<x_{2}<\cdots<x_{n-i+2 m}\right\}=[n] \backslash\{\|r \mathrm{C}(u)\| \mid u \in[i-2 m]\}$ and set $K_{\tilde{\mathrm{C}}}=\left\{x_{1}<x_{2}<\cdots<x_{2 m}\right\}$; note that $x_{\nu}, \nu \in[2 m]$, are uniquely determined by
(i) $x_{1}=\min \left\{x \in \mathcal{B}_{n} \mid x \succeq 1, x \notin r \mathrm{C}, \bar{x} \notin r \mathrm{C}\right\}$,
(ii) $x_{\nu}=\min \left\{x \in \mathcal{B}_{n} \mid x \succ x_{\nu-1}, x \notin r \mathrm{C}, \bar{x} \notin r \mathrm{C}\right\}$ for $\nu \in[2,2 m]$.

Define $r \tilde{\mathrm{C}}=K_{\tilde{\mathrm{C}}} \cup r \mathrm{C}$ and $l \tilde{\mathrm{C}}=\left\{\bar{x} \mid x \in K_{\tilde{\mathrm{C}}}\right\} \cup l \mathrm{C}$; note that $r \tilde{\mathrm{C}}, l \tilde{\mathrm{C}} \in \operatorname{CST}_{B_{n}}\left(\varpi_{i}\right)$ (cf. [6]; see also [26, Algorithm 4.1]).

Let $i \in[n-1]$. Define a $\mathbf{U}^{\prime}$-crystal structure on $\operatorname{QKN}_{B_{n}}\left(\varpi_{i}\right)$ as follows. Let $\tilde{C}=$ $\mathrm{C} \cup\{\overline{0}, \ldots, \overline{0}\} \in \operatorname{QKN}_{B_{n}}\left(\varpi_{i}\right)$ and $j \in I$. Set $\operatorname{wt}(\tilde{\mathrm{C}})=\operatorname{wt}(\mathrm{C}), e_{j} \tilde{\mathrm{C}}=e_{j} \mathrm{C} \cup\{\overline{0}, \ldots, \overline{0}\}$, and $f_{j} \tilde{\mathrm{C}}=f_{j} \mathrm{C} \cup\{\overline{0}, \ldots, \overline{0}\}$; we understand that $e_{j} \tilde{\mathrm{C}}=\mathbf{0}$ (resp. $f_{j} \tilde{\mathrm{C}}=\mathbf{0}$ ) if $e_{j} \mathrm{C}=\mathbf{0}$ (resp. $f_{j} \mathrm{C}=\mathbf{0}$ ).

Recall that $z_{k}=\min I_{\mathrm{C}}$ and $\# K_{\tilde{\mathrm{C}}}=2 m$, where $m \in \mathbb{Z}_{\geqslant 0}$ is as in (QKN-B1). The actions of $e_{0}$ and $f_{0}$ are uniquely determined from $I_{\mathrm{C}}, J_{\mathrm{C}}, K_{\tilde{\mathrm{C}}}$, and $\mathrm{C} \cap\left\{1,2, \overline{2}, \overline{1}, z_{k}, \overline{z_{k}}\right\}$. Let $y_{k}=\min J_{\mathrm{C}}$. If $m>0$, let $x_{1}=\min K_{\tilde{\mathrm{C}}}$ and $x_{2}=\min \left(K_{\tilde{\mathrm{C}}} \backslash\left\{x_{1}\right\}\right)$. The action of $f_{0}$ is illustrated as follows.
(i) Assume that $m=0$ and $y_{k} \notin\{1,2\}$. Set

and set $f_{j} \tilde{\mathrm{C}}=\mathbf{0}$ otherwise.
(ii) Assume that $m>0$ and $y_{k} \notin\{1,2\}$. Set

and set $f_{j} \tilde{\mathrm{C}}=\mathbf{0}$ otherwise.
(iii) Assume that $y_{k} \in\{1,2\}$. Set

and set $f_{j} \tilde{\mathrm{C}}=\mathbf{0}$ otherwise.
The map $e_{0}$ is defined to be such that the condition (C6) in $\S 2.2$ holds. For $\tilde{\mathrm{C}} \in$ $\operatorname{QKN}_{B_{n}}\left(\varpi_{i}\right)$ and $j \in I_{\mathrm{af}}$, set $\varepsilon_{j}(\tilde{\mathrm{C}})=\max \left\{k \in \mathbb{Z}_{\geqslant 0} \mid e_{j}^{k} \tilde{\mathrm{C}} \neq \mathbf{0}\right\}$ and $\varphi_{j}(\tilde{\mathrm{C}})=\max \{k \in$ $\left.\mathbb{Z}_{\geqslant 0} \mid f_{j}^{k} \tilde{C} \neq \mathbf{0}\right\}$. It is Theorem 5.16 (2) below that makes these definitions allowable.

Similarly, we can define a $\mathbf{U}^{\prime}$-crystal structure on $\operatorname{QKN}_{B_{n}}\left(\varpi_{n}\right)$. The maps $e_{0}, f_{0}$ is given as follows. Let $\tilde{C} \in \operatorname{QKN}_{B_{n}}\left(\varpi_{n}\right)$. We see that only the letters $1,2, \overline{2}, \overline{1}$ may be changed in $\tilde{\mathrm{C}}$ when we apply $e_{0}$ or $f_{0}$, and the actions of $e_{0}$ and $f_{0}$ are uniquely determined from $\tilde{\mathrm{C}} \cap\{1,2, \overline{2}, \overline{1}\}$. The action of $f_{0}$ is illustrated by

set $f_{0} \tilde{\mathrm{C}}=\mathbf{0}$ otherwise. The map $e_{0}$ is defined to be such that the condition (C6) in $\S 2.2$ holds.
Theorem 5.16. Assume that $\mathbf{U}$ is of type $B_{n}^{(1)}$.
(1) The set $\mathrm{QKN}_{B_{n}}\left(\varpi_{n}\right)$ equipped with the maps $\mathrm{wt}, e_{j}, f_{j}, \varepsilon_{j}, \varphi_{j}, j \in I_{\mathrm{af}}$, is a $\mathbf{U}^{\prime}$-crystal. The map $\operatorname{QLS}\left(\varpi_{n}\right)=\operatorname{LS}\left(\varpi_{n}\right) \rightarrow \operatorname{QKN}_{B_{n}}\left(\varpi_{n}\right)=\operatorname{CST}_{B_{n}}\left(\varpi_{n}\right)$, $(w ; 0,1) \mapsto \mathbf{T}_{w}^{(n)}$, is an isomorphism of $\mathbf{U}^{\prime}$-crystals.
(2) Assume that $i \in[n-1]$. The set $\mathrm{QKN}_{B_{n}}\left(\varpi_{i}\right)$ equipped with the maps $\mathrm{wt}, e_{j}, f_{j}, \varepsilon_{j}, \varphi_{j}, j \in I_{\mathrm{af}}$, is a $\mathbf{U}^{\prime}$-crystal. The map

$$
\operatorname{QKN}_{B_{n}}\left(\varpi_{i}\right) \rightarrow \operatorname{QLS}\left(\varpi_{i}\right), \quad \tilde{\mathrm{C}} \mapsto(r \tilde{\mathrm{C}}, l \tilde{\mathrm{C}})
$$

is an isomorphism of $\mathbf{U}^{\prime}$-crystals. The inverse of (154) is given as follows. Let $(v, w) \in \operatorname{QLS}\left(\varpi_{i}\right), \mathcal{J}(w)=\mathcal{J}(v)=\left(J_{1}<\cdots<J_{\mu}\right) \in \mathcal{S}_{i}$ and $\mathcal{M}(w)=$ $\left(M_{\nu}\right), \mathcal{M}(v)=\left(N_{\nu}\right) \in \prod_{\nu=1}^{\mu} 2^{J_{\nu}}$. Set $f=\# N_{\mu}-\# M_{\mu} \in \mathbb{Z}_{\geqslant 0}$ if $n \in J_{\mu}$, and set $f=0$ otherwise. Set $2 m=\# M_{1}-\# N_{1} \in 2 \mathbb{Z}_{\geqslant 0}$ if $1,2 \in J_{1}$, and set $m=0$ otherwise; we see from Lemma 5.8 that $m=d_{i}(v, w)$. Define
(i) $\left\{y^{1}<y^{2}<\cdots<y^{l}\right\}=N_{1} \backslash M_{1}$,
(ii) $z^{1}=\min \left\{z \in J_{1} \mid z \succ y^{1}, z \in M_{1} \backslash N_{1}\right\}$, and
(iii) $z^{\nu}=\min \left\{z \in J_{1} \mid z \succ \max \left\{y^{\nu}, z^{\nu-1}\right\}, z \in M_{1} \backslash N_{1}\right\}$ for $\nu \in[2, l]$.

The inverse image of $(v, w)$ is

$$
\begin{aligned}
& \tilde{\mathrm{C}}=\left(J_{1} \backslash\left(M_{1} \cup N_{1}\right)\right) \cup\left\{z^{\nu}, \overline{z^{\nu}} \mid \nu \in[l]\right\} \cup\left\{\bar{z} \mid z \in M_{1} \cap N_{1}\right\} \\
& \cup \bigcup_{\nu=2}^{\mu}\left(\left(J_{\nu} \backslash N_{\nu}\right) \cup\left\{\bar{z} \mid z \in M_{\nu}\right\}\right) \cup\{\underbrace{0,0, \ldots, 0}_{f \text { times }}\} \cup\{\underbrace{\overline{0}, \overline{0}, \ldots, \overline{0}}_{2 m \text { times }}\} ;
\end{aligned}
$$

if we set $\mathrm{C}=\tilde{\mathrm{C}} \backslash\{\underbrace{\overline{0}, \overline{0}, \ldots, \overline{0}}_{2 m \text { times }}\}$, then $\mathrm{C} \in \mathrm{KN}_{B_{n}}\left(\varpi_{i-2 m}\right)$ and

$$
\begin{equation*}
I_{\mathrm{C}}=\left\{z^{\nu} \mid \nu \in[l]\right\} \cup \bigcup_{\nu=2}^{\mu}\left(M_{\nu} \backslash N_{\nu}\right) \cup\{\underbrace{0,0, \ldots, 0}_{f \text { times }}\}, \quad J_{\mathrm{C}}=\bigcup_{\nu=1}^{\mu}\left(N_{\nu} \backslash M_{\nu}\right) . \tag{156}
\end{equation*}
$$

(3) Assume that $i \in[n-1]$. The map

$$
\begin{equation*}
\operatorname{QKN}_{B_{n}}\left(\varpi_{i}\right) \rightarrow \bigsqcup_{m=0}^{\left\lfloor\frac{i}{2}\right\rfloor} \mathrm{KN}_{B_{n}}\left(\varpi_{i-2 m}\right), \tilde{\mathrm{C}}=\mathrm{C} \cup\{\underbrace{\overline{0}, \overline{0}, \ldots, \overline{0}}_{2 m \text { times }}\} \mapsto \mathrm{C} \tag{157}
\end{equation*}
$$

is an isomorphism of $\mathfrak{g}$-crystals, where C and $m$ are as in (QKN-B1)-(QKN$\mathrm{B} 2)$ for $\tilde{\mathrm{C}}$. Here we understand that $\mathrm{KN}_{B_{n}}\left(\varpi_{0}\right)=\{\varnothing\}$ is a $\mathfrak{g}$-crystal isomorphic to the crystal basis of the trivial module. The inverse image of $\mathrm{C} \in$ $\mathrm{KN}_{B_{n}}\left(\varpi_{i-2 m}\right)$ under the map (157) is $\tilde{\mathrm{C}}=\mathrm{C} \cup\{\underbrace{\overline{0}, \overline{0}, \ldots, \overline{0}}_{2 m \text { times }}\}$.
The proof of (1) and (3) in Theorem 5.16 is straightforward (cf. [7, Lemma 2.7 (i)]). In §5.6, we will give the proof for Theorem 5.16 (2).

Recall the partial order $\preceq$ on $\operatorname{CST}_{B_{n}}\left(\varpi_{i}\right) \times \mathbb{Z}$ (see Definition 4.20).
Definition 5.17. Let $i \in I$ and $m \in \mathbb{Z}_{\geqslant 0}$.
(1) Let $\mathbb{T}=\left(\mathrm{T}_{1} \mathrm{~T}_{2} \cdots \mathrm{~T}_{m},\left(c_{1}, c_{2}, \ldots, c_{m}\right)\right)$, where $\mathrm{T}_{\nu} \in \operatorname{QKN}_{B_{n}}\left(\varpi_{n}\right)=$ $\operatorname{CST}_{B_{n}}\left(\varpi_{n}\right)$ and $c_{\nu} \in \mathbb{Z}$ for $\nu \in[m]$. We call $\mathbb{T}$ a semi-infinite $K N B_{n}$ tableau of shape $m \varpi_{n}$ if

$$
\begin{equation*}
\left(\mathrm{T}_{\nu}, c_{\nu}\right) \succeq\left(\mathrm{T}_{\nu+1}, c_{\nu+1}\right) \tag{158}
\end{equation*}
$$

in $\operatorname{CST}_{B_{n}}\left(\varpi_{i}\right) \times \mathbb{Z}$ for $\nu \in[m-1]$.
(2) Assume that $i \in[n-1]$. Let $\mathbb{T}=\left(\tilde{\mathrm{C}}_{1} \tilde{\mathrm{C}}_{2} \ldots \tilde{\mathrm{C}}_{m},\left(c_{1}, c_{2}, \ldots, c_{m}\right)\right)$, where $\tilde{\mathrm{C}}_{\nu} \in$ $\mathrm{QKN}_{B_{n}}\left(\varpi_{i}\right)$ and $c_{\nu} \in \mathbb{Z}$ for $\nu \in[m]$. We call $\mathbb{T}$ a semi-infinite $K N B_{n}$-tableau of shape $m \varpi_{i}$ if

$$
\begin{equation*}
\left(l \tilde{\mathrm{C}}_{\nu}, c_{\nu}-d_{i}\left(r \tilde{\mathrm{C}}_{\nu}, l \tilde{\mathrm{C}}_{\nu}\right)\right) \succeq\left(r \tilde{\mathrm{C}}_{\nu+1}, c_{\nu+1}+d_{i}\left(r \tilde{\mathrm{C}}_{\nu+1}, l \tilde{\mathrm{C}}_{\nu+1}\right)\right) \tag{159}
\end{equation*}
$$

in $\operatorname{CST}_{B_{n}}\left(\varpi_{i}\right) \times \mathbb{Z}$ for $\nu \in[m-1]$.
Let $\mathbb{Y}_{B_{n}}^{\frac{\infty}{2}}\left(m \varpi_{i}\right)$ be the set of semi-infinite $K N B_{n}$-tableaux of shape $m \varpi_{i}$. For $\lambda=$ $\sum_{i \in I} m_{i} \varpi_{i} \in P^{+}$, set $\mathbb{Y}_{B_{n}}^{\frac{\infty}{2}}(\lambda)=\prod_{i \in I} \mathbb{Y}_{B_{n}}^{\frac{\infty}{2}}\left(m_{i} \varpi_{i}\right)$. We call an element of $\mathbb{Y}_{B_{n}}^{\frac{\infty}{2}}(\lambda) a$ semi-infinite $K N B_{n}$-tableau of shape $\lambda$.

Let $\mathrm{QKN}_{B_{n}}\left(\varpi_{i}\right)_{\text {af }}$ denote the affinization of the $\mathbf{U}^{\prime}$-crystal $\mathrm{QKN}_{B_{n}}\left(\varpi_{i}\right)$ (see §2.2). Combining Theorem 2.8, Proposition 4.21 (2), Lemma 5.9, and Definition 5.17 we obtain the following theorem.

Theorem 5.18. Assume that $\mathbf{U}$ is of type $B_{n}^{(1)}$. Let $\lambda=\sum_{i \in I} m_{i} \varpi_{i} \in P^{+}$. For each $i \in I$, the image of the map

$$
\begin{align*}
& \mathbb{Y}_{B_{n}}^{\frac{\infty}{2}}\left(m_{i} \varpi_{i}\right) \rightarrow \mathrm{QKN}_{B_{n}}\left(\varpi_{i}\right)_{\mathrm{af}}^{\otimes m_{i}}, \\
& \left(\mathrm{C}_{1} \mathrm{C}_{2} \cdots \mathrm{C}_{m_{i}},\left(c_{1}, c_{2}, \ldots, c_{m_{i}}\right)\right) \mapsto \underset{\nu \in\left[m_{i}\right]}{\bigotimes}\left(\mathrm{C}_{\nu}, c_{\nu}\right), \tag{160}
\end{align*}
$$

is a U-subcrystal. Hence we can define a U-crystal structure on $\mathbb{Y}_{B_{n}}^{\frac{\infty}{2}}\left(m_{i} \varpi_{i}\right)$ to be such that the map (160) is a strict embedding of $\mathbf{U}$-crystals. In particular, $\mathbb{Y}_{B_{n}}^{\frac{\infty}{2}}(\lambda)$ is $a \mathbf{U}$-subcrystal of $\bigotimes_{i \in I} \mathrm{QKN}_{B_{n}}\left(\varpi_{i}\right)_{\mathrm{af}}^{\otimes m_{i}}$. Then $\mathbb{Y}_{B_{n}}^{\frac{\infty}{2}}(\lambda)$ is isomorphic, as a $\mathbf{U}$-crystal, to the crystal basis $\mathcal{B}(\lambda)$.
5.5. Type $D_{n}^{(1)}$. Throughout this subsection, we assume that $\mathfrak{g}$ and $W$ are of type $D_{n}$. Recall that $I=[n], \Delta=\left\{ \pm\left(\varepsilon_{s} \pm \varepsilon_{t}\right) \mid s, t \in[n], s<t\right\}$, and $\Pi=\left\{\alpha_{s}=\right.$ $\left.\varepsilon_{s}-\varepsilon_{s+1} \mid s \in[n-1]\right\} \sqcup\left\{\alpha_{n}=\varepsilon_{n-1}+\varepsilon_{n}\right\}$. The highest root is $\varepsilon_{1}+\varepsilon_{2}=\alpha_{1}+2 \alpha_{2}+$ $\cdots+2 \alpha_{n-2}+\alpha_{n-1}+\alpha_{n}$. We identify $\varpi_{i}$ with $\varepsilon_{1}+\varepsilon_{2}+\cdots \varepsilon_{i}$ if $i \in[n-2]$, with $\frac{1}{2}\left(\varepsilon_{1}+\varepsilon_{2}+\cdots+\varepsilon_{n-1}-\varepsilon_{n}\right)$ if $i=n-1$, and with $\frac{1}{2}\left(\varepsilon_{1}+\varepsilon_{2}+\cdots+\varepsilon_{n-1}+\varepsilon_{n}\right)$ if $i=n$.

Let $i \in[2, n-2]$. A map C : $[i] \rightarrow \mathcal{D}_{n}$ is, by definition, a Kashiwara-Nakashima $D_{n}$-column (KN $D_{n}$-column for short) of shape $\varpi_{i}$ if
(KN-D1) $\mathrm{C}(1) \nsucceq \mathrm{C}(2) \nsucceq \cdots \nsucceq \mathrm{C}(i)$,
(KN-D2) if $t=\mathrm{C}(p)=\sigma(\mathrm{C}(q)) \in[n]$ for some $p, q \in[i]$, then $|q-p|>i-t$;
note that $n, \bar{n} \in \mathcal{D}_{n}$ may appear in C more than once. Let $\mathrm{KN}_{D_{n}}\left(\varpi_{i}\right)$ be the set of KN $D_{n}$-columns of shape $\varpi_{i}$.

Let $i \in[2, n-2]$. Let $C:[i] \rightarrow \mathcal{D}_{n}$ be a map satisfying (KN-D1). Define $\mathrm{C}^{\wedge}$ : $[i] \rightarrow \mathcal{B}_{n}$ to be such that $\mathrm{C}^{\wedge}(u)=\mathrm{C}^{\wedge}(u+1)=0$ if $\mathrm{C}(u)=\bar{n}$ and $\mathrm{C}(u+1)=n$ for $u \in[i]$, and $\mathrm{C}^{\wedge}(u)=\mathrm{C}(u)$ otherwise. We say that C can be split if $\mathrm{C}^{\wedge}$ can be split. If $\mathrm{C} \in \mathrm{KN}_{D_{n}}\left(\varpi_{i}\right)$ can be split, then we write $r \mathrm{C}=r \mathrm{C}^{\wedge}$ and $l \mathrm{C}=l \mathrm{C}^{\wedge}$; note that $r C, l C \in \operatorname{CST}_{D_{n}}\left(\varpi_{i}\right)$. For convenience we also denote by $\mathrm{KN}_{D_{n}}\left(\varpi_{i}\right)=\operatorname{CST}_{D_{n}}\left(\varpi_{i}\right)$ for $i \in\{1, n-1, n\}$.

Define a $\mathfrak{g}$-crystal structure on $\mathrm{KN}_{D_{n}}\left(\varpi_{i}\right)$ for $i \in[n-2]$ as follows (cf. [18, §6]); for the $\mathfrak{g}$-crystal structure on $\mathrm{KN}_{D_{n}}\left(\varpi_{i}\right)$ for $i \in\{n-1, n\}$ we refer the reader to [21, $\S 2.3]$. The maps wt, $\varepsilon_{j}, \varphi_{j}$ for $j \in I$ and $e_{j}, f_{j}$ for $j \in[n-2]$ are defined in the same manner as those for $\mathrm{KN}_{C_{n}}\left(\varpi_{i}\right)$. Note that only the letters $n-1, n, \bar{n}, \overline{n-1}$ may be changed in C when we apply $e_{n-1}, e_{n}, f_{n-1}$, or $f_{n}$. To define the action of $f_{n-1}$, let $\{\mathrm{C}(u) \mid u \in[i], \mathrm{C}(u) \in\{n-1, n, \bar{n}, \overline{n-1}\}\}=\left\{\mathrm{C}\left(u_{1}\right) \nsucc \mathrm{C}\left(u_{2}\right) \nsucc \cdots \nsucc \mathrm{C}\left(u_{p}\right)\right\}$, where $1 \leqslant u_{1}<u_{2}<\cdots<u_{p} \leqslant i$, and continue deleting a successive pair $a \nsucc b$ such that $(a, b) \in\{(\bar{n}, n),(n-1, n),(\bar{n}, \overline{n-1}),(n-1, \overline{n-1})\}$ from $\mathrm{C}\left(u_{1}\right) \nsucc \mathrm{C}\left(u_{2}\right) \nsucc \cdots \nsucc \mathrm{C}\left(u_{p}\right)$
until no such pair exists. Let $\mathrm{C}\left(v_{1}\right) \nsucc \mathrm{C}\left(v_{2}\right) \nsucc \cdots \nsucc \mathrm{C}\left(v_{q}\right)$ be the resulting sequence. It follows that
(161)

Then the action of $f_{n-1}$ is uniquely determined from (161), and only one of the entries in (161) may be changed in $C$ when we apply $f_{n-1}$. This is illustrated by

set $f_{n-1} \mathrm{C}=\mathbf{0}$ otherwise. We next define the action of $f_{n}$. Similarly, continue deleting a successive pair $a \nsucc b$ such that $(a, b) \in\{(n, \bar{n}),(n-1, \bar{n}),(n, \overline{n-1}),(n-1, \overline{n-1})\}$ from $\mathrm{C}\left(u_{1}\right) \nsucc \mathrm{C}\left(u_{2}\right) \nsucc \cdots \nsucc \mathrm{C}\left(u_{p}\right)$. Let $\mathrm{C}\left(v_{1}^{\prime}\right) \nsucc \mathrm{C}\left(v_{2}^{\prime}\right) \nsucc \cdots \nsucc \mathrm{C}\left(v_{r}^{\prime}\right)$ be the resulting sequence. It follows that
(163)

Then the action of $f_{n}$ is uniquely determined from (163), and only one of the entries in (163) may be changed in $C$ when we apply $f_{n}$. This is illustrated by

$$
\begin{array}{|c|}
\hline n-1  \tag{164}\\
\hline n \\
\hline
\end{array} \xrightarrow{f_{n}} \begin{array}{|c|}
\hline n \\
\overline{n-1} \\
\hline
\end{array}
$$

set $f_{n} \mathrm{C}=\mathbf{0}$ otherwise.
The next lemma is a reformulation of [21, Corollary 3.1.11 and Remark 3.1.13] in terms of Maya diagrams.

Lemma 5.19. Assume that $\mathfrak{g}$ and $W$ are of type $D_{n}$.
(1) Assume that $i \in\{1, n-1, n\}$. The map $\mathrm{LS}\left(\varpi_{i}\right) \rightarrow \mathrm{KN}_{D_{n}}\left(\varpi_{i}\right)=\operatorname{CST}_{D_{n}}\left(\varpi_{i}\right)$, $(w ; 0,1) \mapsto \mathbf{T}_{w}^{(i)}$, is an isomorphism of $\mathfrak{g}$-crystals.
(2) Assume that $i \in[2, n-2]$. For a map $\mathrm{C}:[i] \rightarrow \mathcal{D}_{n}$ satisfying (KN-D1), we have $\mathrm{C} \in \mathrm{KN}_{D_{n}}\left(\varpi_{i}\right)$ if and only if C can be split. Hence the map $\mathrm{KN}_{D_{n}}\left(\varpi_{i}\right) \rightarrow$ $\mathrm{KN}_{B_{n}}\left(\varpi_{i}\right), \mathrm{C} \mapsto \mathrm{C}^{\wedge}$, is injective. The map

$$
\begin{equation*}
\mathrm{KN}_{D_{n}}\left(\varpi_{i}\right) \rightarrow \mathrm{LS}\left(\varpi_{i}\right), \mathrm{C} \mapsto(r \mathrm{C}, l \mathrm{C}), \tag{165}
\end{equation*}
$$

is an isomorphism of $\mathfrak{g}$-crystals. The inverse of (165) is given as follows. Let $(v, w) \in \operatorname{LS}\left(\varpi_{i}\right), \mathcal{J}(w)=\mathcal{J}(v)=\left(J_{1}<\cdots<J_{\mu}\right) \in \mathcal{S}_{i}, \mathcal{M}(w)=$ $\left(M_{\nu}\right), \mathcal{M}(v)=\left(N_{\nu}\right) \in \prod_{\nu=1}^{\mu} 2^{J_{\nu}}$, and $f=\# N_{\mu}-\# M_{\mu} \in 2 \mathbb{Z}_{\geqslant 0}$. The inverse image of $(v, w)$ is the $K N D_{n}$-column C such that

$$
\begin{align*}
\mathrm{C}^{\wedge} & =\{v(u) \mid u \in[i], v(u) \preceq n\} \cup\{w(u) \mid u \in[i], w(u) \succeq \bar{n}\} \cup\{\underbrace{0,0, \ldots, 0}_{f \text { times }}\} \\
& =\bigcup_{\nu=1}^{\mu}\left(\left(J_{\nu} \backslash N_{\nu}\right) \cup\left\{\bar{z} \mid z \in M_{\nu}\right\}\right) \cup\{\underbrace{0,0, \ldots, 0}_{f \text { times }}\} ; \tag{166}
\end{align*}
$$

$$
\text { we have } I_{\mathrm{C} \wedge}=\bigcup_{\nu=1}^{\mu}\left(M_{\nu} \backslash N_{\nu}\right) \cup\{\underbrace{0,0, \ldots, 0}_{f \text { times }}\} \text { and } J_{\mathrm{C} \wedge}=\bigcup_{\nu=1}^{\mu}\left(N_{\nu} \backslash M_{\nu}\right) \text {. }
$$

Set

$$
\begin{equation*}
\tilde{\mathcal{D}}_{n}=\mathcal{D}_{n} \cup\{\overline{0}\}=\left\{1 \prec 2 \prec \cdots \prec n-1 \prec \frac{n}{\bar{n}} \prec \overline{n-1} \prec \cdots \prec \overline{2} \prec \overline{1} \prec \overline{0}\right\} . \tag{167}
\end{equation*}
$$

Definition 5.20. Let $i \in[2, n-2]$. A map $\tilde{C}:[i] \rightarrow \tilde{\mathcal{D}}_{n}$ is, by definition, a quantum Kashiwara-Nakashima $D_{n}$-column (QKN $D_{n}$-column for short) of shape $\varpi_{i}$ if
(QKN-D1) there exists $m \in \mathbb{Z}_{\geqslant 0}$ such that $2 m \leqslant i$ and

$$
\begin{align*}
\tilde{\mathrm{C}}(1) & \nsucceq \tilde{\mathrm{C}}(2) \nsucceq \cdots \nsucceq \tilde{\mathrm{C}}(i-2 m) \\
& \prec \overline{0}=\tilde{\mathrm{C}}(i-2 m+1)=\cdots=\tilde{\mathrm{C}}(i-1)=\tilde{\mathrm{C}}(i), \tag{168}
\end{align*}
$$

(QKN-D2) the map $\mathrm{C}:[i-2 m] \rightarrow \mathcal{D}_{n}, u \mapsto \tilde{\mathrm{C}}(u)$, is a KN $D_{n}$-column of shape $\varpi_{i-2 m}$; in this case, we write $\tilde{\mathrm{C}}=\mathrm{C} \cup\{\underbrace{\overline{0}, \overline{0}, \ldots, \overline{0}}_{2 m \text { times }}\}$ for brevity. Let $\mathrm{QKN}_{D_{n}}\left(\varpi_{i}\right)$ be the set of QKN $D_{n}$-columns of shape $\varpi_{i}$. For convenience we also denote by $\operatorname{QKN}_{D_{n}}\left(\varpi_{i}\right)=$ $\operatorname{CST}_{D_{n}}\left(\varpi_{i}\right)$ for $i \in\{1, n-1, n\}$.

For a map $\tilde{\mathrm{C}}:[i] \rightarrow \tilde{\mathcal{D}}_{n}$, define $\tilde{\mathrm{C}}^{\wedge}:[i] \rightarrow \tilde{\mathcal{B}}_{n}$ to be such that $\tilde{\mathrm{C}}^{\wedge}(u)=\tilde{\mathrm{C}}^{\wedge}(u+1)=0$ if $\tilde{\mathrm{C}}(u)=\bar{n}$ and $\tilde{\mathrm{C}}(u+1)=n$ for $u \in[i]$, and $\tilde{\mathrm{C}}^{\wedge}(u)=\tilde{\mathrm{C}}(u)$ otherwise. We see that if $\tilde{\mathrm{C}}=\mathrm{C} \cup\{\underbrace{\overline{0}, \overline{0}, \ldots, \overline{0}}_{2 m \text { times }}\} \in \operatorname{QKN}_{D_{n}}\left(\varpi_{i}\right)$, then $\tilde{\mathrm{C}}^{\wedge} \in \operatorname{QKN}_{B_{n}}\left(\varpi_{i}\right)$ and, in consequence, $\tilde{\mathrm{C}}^{\wedge}=\mathrm{C}^{\wedge} \cup\{\underbrace{\overline{0}, \overline{0}, \ldots, \overline{0}}_{2 m \text { times }}\}$. For $\tilde{\mathrm{C}} \in \mathrm{QKN}_{D_{n}}\left(\varpi_{i}\right)$, define $r \tilde{\mathrm{C}}=r \tilde{\mathrm{C}}^{\wedge}$ and $l \tilde{\mathrm{C}}=l \tilde{\mathrm{C}}^{\wedge}$; note that $r \tilde{\mathrm{C}}, l \tilde{\mathrm{C}} \in \mathrm{CST}_{D_{n}}\left(\varpi_{i}\right)$.

Define a $\mathbf{U}^{\prime}$-crystal structure on $\mathrm{QKN}_{D_{n}}\left(\varpi_{i}\right)$ in the same manner as that on $\operatorname{QKN}_{B_{n}}\left(\varpi_{i}\right)$.

Theorem 5.21. Assume that $\mathbf{U}$ is of type $D_{n}^{(1)}$.
(1) Assume that $i \in\{1, n-1, n\}$. The set $\operatorname{QKN}_{D_{n}}\left(\varpi_{i}\right)$ equipped with the maps $\mathrm{wt}, e_{j}, f_{j}, \varepsilon_{j}, \varphi_{j}, j \in I_{\mathrm{af}}$, is a $\mathbf{U}^{\prime}$-crystal. The map $\operatorname{QLS}\left(\varpi_{i}\right)=\operatorname{LS}\left(\varpi_{i}\right) \rightarrow$ $\operatorname{QKN}_{D_{n}}\left(\varpi_{i}\right)=\operatorname{CST}_{D_{n}}\left(\varpi_{i}\right),(w ; 0,1) \mapsto \mathrm{T}_{w}^{(i)}$, is an isomorphism of $\mathbf{U}^{\prime}-$ crystals.
(2) Assume that $i \in[2, n-2]$. The set $\mathrm{QKN}_{D_{n}}\left(\varpi_{i}\right)$ equipped with the maps $\mathrm{wt}, e_{j}, f_{j}, \varepsilon_{j}, \varphi_{j}, j \in I_{\mathrm{af}}$, is a $\mathbf{U}^{\prime}$-crystal. The map

$$
\begin{equation*}
\operatorname{QKN}_{D_{n}}\left(\varpi_{i}\right) \rightarrow \operatorname{QLS}\left(\varpi_{i}\right), \tilde{\mathrm{C}} \mapsto(r \tilde{\mathrm{C}}, l \tilde{\mathrm{C}}) \tag{169}
\end{equation*}
$$

is an isomorphism of $\mathbf{U}^{\prime}$-crystals. The inverse of (169) is given as follows. Let $(v, w) \in \operatorname{QLS}\left(\varpi_{i}\right), \mathcal{J}(w)=\mathcal{J}(v)=\left(J_{1}<\cdots<J_{\mu}\right) \in \mathcal{S}_{i}$ and $\mathcal{M}(w)=$ $\left(M_{\nu}\right), \mathcal{M}(v)=\left(N_{\nu}\right) \in \prod_{\nu=1}^{\mu} 2^{J_{\nu}}$. Set $f=\# N_{\mu}-\# M_{\mu} \in 2 \mathbb{Z}_{\geqslant 0}$ if $n-1, n \in J_{\mu}$, and set $f=0$ otherwise. Set $2 m=\# M_{1}-\# N_{1} \in 2 \mathbb{Z}_{\geqslant 0}$ if $1,2 \in J_{1}$, and set $m=0$ otherwise; we see from Lemma 5.8 that $m=d_{i}(v, w)$. Define
(i) $\left\{y^{1}<y^{2}<\cdots<y^{l}\right\}=N_{1} \backslash M_{1}$,
(ii) $z^{1}=\min \left\{z \in J_{1} \mid z \succ y^{1}\right.$, $\left.z \in M_{1} \backslash N_{1}\right\}$, and
(iii) $z^{\nu}=\min \left\{z \in J_{1} \mid z \succ \max \left\{y^{\nu}, z^{\nu-1}\right\}, z \in M_{1} \backslash N_{1}\right\}$ for $\nu \in[2, l]$.

Let C be the $K N D_{n}$-column of shape $\varpi_{i-2 m}$ such that

$$
\mathrm{C}^{\wedge}=\left(J_{1} \backslash\left(M_{1} \cup N_{1}\right)\right) \cup\left\{z^{\nu}, \overline{z^{\nu}} \mid \nu \in[l]\right\} \cup\left\{\bar{z} \mid z \in M_{1} \cap N_{1}\right\}
$$

$$
\begin{equation*}
\cup \bigcup_{\nu=2}^{\mu}\left(\left(J_{\nu} \backslash N_{\nu}\right) \cup\left\{\bar{z} \mid z \in M_{\nu}\right\}\right) \cup\{\underbrace{0,0, \ldots, 0}_{f \text { times }}\} \tag{170}
\end{equation*}
$$

we have $I_{\mathrm{C} \wedge}=\left\{z^{\nu} \mid \nu \in[l]\right\} \cup \bigcup_{\nu=2}^{\mu}\left(M_{\nu} \backslash N_{\nu}\right) \cup\{\underbrace{0,0, \ldots, 0}_{f \text { times }}\}$ and $J_{\mathrm{C} \wedge}=$ $\bigcup_{\nu=1}^{\mu}\left(N_{\nu} \backslash M_{\nu}\right)$. The inverse image of $(v, w)$ is $\tilde{\mathrm{C}}=\mathrm{C} \cup\{\underbrace{\overline{0}, \overline{0}, \ldots, \overline{0}}_{2 m \text { times }}\}$.
(3) Assume that $i \in[2, n-2]$. The map

$$
\begin{equation*}
\operatorname{QKN}_{D_{n}}\left(\varpi_{i}\right) \rightarrow \bigsqcup_{m=0}^{\left\lfloor\frac{i}{2}\right\rfloor} \mathrm{KN}_{D_{n}}\left(\varpi_{i-2 m}\right), \tilde{\mathrm{C}}=\mathrm{C} \cup\{\underbrace{\overline{0}, \overline{0}, \ldots, \overline{0}}_{2 m \text { times }}\} \mapsto \mathrm{C}, \tag{171}
\end{equation*}
$$

is an isomorphism of $\mathfrak{g}$-crystals, where C and $m$ are as in (QKN-D1)-(QKND2) for $\tilde{\mathrm{C}}$. Here we understand that $\mathrm{KN}_{D_{n}}\left(\varpi_{0}\right)=\{\varnothing\}$ is a $\mathfrak{g}$-crystal isomorphic to the crystal basis of the trivial module. The inverse image of $\mathrm{C} \in$ $\mathrm{KN}_{D_{n}}\left(\varpi_{i-2 m}\right)$ under the map (171) is $\tilde{\mathrm{C}}=\mathrm{C} \cup\{\underbrace{\overline{0}, \overline{0}, \ldots, \overline{0}}_{2 m \text { times }}\}$.
The proof of (1) and (3) in Theorem 5.21 is straightforward (cf. [7, Lemma 2.7 (ii)]). Theorem 5.21 (2) may be proved in much the same way as Theorem 5.16 (2) (see §5.6); the details are left to the reader.

Recall the partial order $\preceq$ on $\operatorname{CST}_{D_{n}}\left(\varpi_{i}\right) \times \mathbb{Z}$ (see Definition 4.36).
Definition 5.22. Let $i \in I$ and $m \in \mathbb{Z}_{\geqslant 0}$.
(1) Assume that $i \in\{1, n-1, n\}$. Let $\mathbb{T}=\left(\mathrm{T}_{1} \mathrm{~T}_{2} \cdots \mathrm{~T}_{m},\left(c_{1}, c_{2}, \ldots, c_{m}\right)\right)$, where $\mathrm{T}_{\nu} \in \operatorname{CST}_{D_{n}}\left(\varpi_{i}\right)$ and $c_{\nu} \in \mathbb{Z}$ for $\nu \in[m]$. We call $\mathbb{T}$ a semi-infinite $K N$ $D_{n}$-tableau of shape $m \varpi_{i}$ if

$$
\begin{equation*}
\left(\mathrm{T}_{\nu}, c_{\nu}\right) \succeq\left(\mathrm{T}_{\nu+1}, c_{\nu+1}\right) \tag{172}
\end{equation*}
$$

in $\operatorname{CST}_{D_{n}}\left(\varpi_{i}\right) \times \mathbb{Z}$ for $\nu \in[m-1]$.
(2) Assume that $i \in[2, n-2]$. Let $\mathbb{T}=\left(\tilde{\mathrm{C}}_{1} \tilde{\mathrm{C}}_{2} \cdots \tilde{\mathrm{C}}_{m},\left(c_{1}, c_{2}, \ldots, c_{m}\right)\right)$, where $\tilde{\mathrm{C}}_{\nu} \in$ $\mathrm{QKN}_{D_{n}}\left(\varpi_{i}\right)$ and $c_{\nu} \in \mathbb{Z}$ for $\nu \in[m]$. We call $\mathbb{T}$ a semi-infinite $K N D_{n}$-tableau of shape $m \varpi_{i}$ if

$$
\begin{equation*}
\left(l \tilde{\mathrm{C}}_{\nu}, c_{\nu}-d_{i}\left(r \tilde{\mathrm{C}}_{\nu}, l \tilde{\mathrm{C}}_{\nu}\right)\right) \succeq\left(r \tilde{\mathrm{C}}_{\nu+1}, c_{\nu+1}+d_{i}\left(r \tilde{\mathrm{C}}_{\nu+1}, l \tilde{\mathrm{C}}_{\nu+1}\right)\right) \tag{173}
\end{equation*}
$$

in $\operatorname{CST}_{D_{n}}\left(\varpi_{i}\right) \times \mathbb{Z}$ for $\nu \in[m-1]$.

Let $\mathbb{Y}_{D_{n}}^{\frac{\infty}{2}}\left(m \varpi_{i}\right)$ be the set of semi-infinite $K N D_{n}$-tableaux of shape $m \varpi_{i}$. For $\lambda=$ $\sum_{i \in I} m_{i} \varpi_{i} \in P^{+}$, set $\mathbb{Y}_{D_{n}}^{\frac{\infty}{2}}(\lambda)=\prod_{i \in I} \mathbb{Y}_{D_{n}}^{\frac{\infty}{2}}\left(m_{i} \varpi_{i}\right)$. We call an element of $\mathbb{Y}_{D_{n}}^{\frac{\infty}{2}}(\lambda) a$ semi-infinite $K N D_{n}$-tableau of shape $\lambda$.

Let $\mathrm{QKN}_{D_{n}}\left(\varpi_{i}\right)_{\text {af }}$ denote the affinization of the $\mathbf{U}^{\prime}$-crystal $\mathrm{QKN}_{D_{n}}\left(\varpi_{i}\right)$ (see $\S 2.2$ ). Combining Theorem 2.8, Proposition 4.37 (2), Lemma 5.9, and Definition 5.22 we obtain the following theorem.

Theorem 5.23. Let $\lambda=\sum_{i \in I} m_{i} \varpi_{i} \in P^{+}$. For each $i \in I$, the image of the map

$$
\begin{align*}
& \mathbb{Y}_{D_{n}}^{\frac{\infty}{2}}\left(m_{i} \varpi_{i}\right) \rightarrow \mathrm{QKN}_{D_{n}}\left(\varpi_{i}\right)_{\mathrm{af}}^{\otimes m_{i}}, \\
& \left(\mathrm{C}_{1} \mathrm{C}_{2} \cdots \mathrm{C}_{m_{i}},\left(c_{1}, c_{2}, \ldots, c_{m_{i}}\right)\right) \mapsto \underset{\nu \in\left[m_{i}\right]}{\bigotimes}\left(\mathrm{C}_{\nu}, c_{\nu}\right), \tag{174}
\end{align*}
$$

is a U-subcrystal. Hence we can define a U-crystal structure on $\mathbb{Y}_{D_{n}}^{\frac{\infty}{2}}\left(m_{i} \varpi_{i}\right)$ to be such that the map (174) is a strict embedding of $\mathbf{U}$-crystals. In particular, $\mathbb{Y}_{D_{n}}^{\frac{\infty}{2}}(\lambda)$ is $a \mathbf{U}$-subcrystal of $\bigotimes_{i \in I} \mathrm{QKN}_{D_{n}}\left(\varpi_{i}\right)_{\mathrm{af}}^{\otimes m_{i}}$. Then $\mathbb{Y}_{D_{n}}^{\frac{\infty}{2}}(\lambda)$ is isomorphic, as a U-crystal, to the crystal basis $\mathcal{B}(\lambda)$.
5.6. Proof of Theorem 5.16 (2). Throughout this subsection, we assume that $\mathfrak{g}$ and $W$ are of type $B_{n}$, and that $i \in[n-1]$. This subsection is devoted to the proof of Theorem 5.16 (2). We have divided the proof into a sequence of lemmas.

Recall the notation and terminology in $\S 5.2$ and $\S 5.4$. A segment is a subset of $[n]$ of the form $[j, k]$ with $j, k \in[n]$ and $j \leqslant k$. For segments $J=[j, k]$ and $J^{\prime}=\left[j^{\prime}, k^{\prime}\right]$, write $J<J^{\prime}$ if $k+1<j^{\prime}$. $\mathcal{S}_{i}$ is the family of all sequences $\left(J_{1}<\cdots<J_{\mu}\right)$, $\mu \geqslant 1$, of segments such that $\sum_{\nu=1}^{\mu} \# J_{\nu}=i$. For $\mathcal{J}=\left(J_{1}<\cdots<J_{\mu}\right) \in \mathcal{S}_{i}$, write $\bigcup \mathcal{J}=J_{1} \sqcup \cdots \sqcup J_{\mu}$. For $\mathcal{J}, \mathcal{J}^{\prime} \in \mathcal{S}_{i}$, we have $\mathcal{J}=\mathcal{J}^{\prime}$ if and only if $\bigcup \mathcal{J}=\bigcup \mathcal{J}^{\prime}$. For $w \in W^{I \backslash\{i\}}$, let $\mathcal{J}(w) \in \mathcal{S}_{i}$ be such that $\bigcup \mathcal{J}(w)=\{\|w(u)\| \mid u \in[i]\}$. For $w \in W^{I \backslash\{i\}}$, with $\mathcal{J}(w)=\left(J_{1}<\cdots<J_{\mu}\right) \in \mathcal{S}_{i}$, write $\mathcal{M}(w)=\left(J_{\nu} \cap\{\|w(u)\| \mid u \in\right.$ $[i], w(u) \succeq \bar{n}\})_{\nu=1}^{\mu} \in \prod_{\nu=1}^{\mu} 2^{J_{\nu}}($ see (125)).

Let $\tilde{\mathrm{C}}=\mathrm{C} \cup\{\underbrace{\overline{0}, \ldots, \overline{0}}_{2 m \text { times }}\} \in \operatorname{QKN}_{B_{n}}\left(\varpi_{i}\right)$, with $\mathrm{C} \in \mathrm{KN}_{B_{n}}\left(\varpi_{i-2 m}\right)$ (see Definition
5.15). $I_{C}=\left\{z_{1} \succeq z_{2} \succeq \cdots \succeq z_{k}\right\}$ is the multiset of $z \in C$ such that $z \preceq 0$ and $\{z, \sigma(z)\} \subset \mathrm{C} . J_{\mathrm{C}}=\left\{y_{1}>y_{2}>\cdots>y_{k}\right\}$ is a subset of $[n]$ such that $\# I_{\mathrm{C}}=\# J_{\mathrm{C}}$ and
(i) $y_{1}=\max \left\{y \in \mathcal{B}_{n} \mid y \prec z_{1}, y \notin \mathrm{C}, \bar{y} \notin \mathrm{C}\right\}$,
(ii) $y_{\nu}=\max \left\{y \in \mathcal{B}_{n} \mid y \prec \min \left\{y_{\nu-1}, z_{\nu}\right\}, y \notin \mathrm{C}, \bar{y} \notin \mathrm{C}\right\}$ for $\nu \in[2, k]$.

We have

$$
\begin{align*}
r \mathrm{C} & =\left(\mathrm{C} \backslash\left\{\sigma(z) \mid z \in I_{\mathrm{C}}\right\}\right) \cup\left\{\sigma(y) \mid y \in J_{\mathrm{C}}\right\} \in \operatorname{CST}_{B_{n}}\left(\varpi_{i-2 m}\right), \\
l \mathrm{C} & =\left(\mathrm{C} \backslash I_{\mathrm{C}}\right) \cup J_{\mathrm{C}} \in \operatorname{CST}_{B_{n}}\left(\varpi_{i-2 m}\right) . \tag{175}
\end{align*}
$$

Then $K_{\tilde{\mathrm{c}}}=\left\{x_{1}<x_{2}<\cdots<x_{2 m}\right\}$, where $\left\{x_{1}<x_{2}<\cdots<x_{n-i+2 m}\right\}=[n] \backslash$ $\{\|r \mathrm{C}(u)\| \mid u \in[i-2 m]\}$. Note that $\# K_{\tilde{\mathrm{C}}}=2 m$. We have

$$
\begin{align*}
r \tilde{\mathrm{C}} & =K_{\tilde{\mathrm{C}}} \cup r \mathrm{C} \in \operatorname{CST}_{B_{n}}\left(\varpi_{i}\right), \\
l \tilde{\mathrm{C}} & =\left\{\bar{x} \mid x \in K_{\tilde{\mathrm{C}}}\right\} \cup l \mathrm{C} \in \operatorname{CST}_{B_{n}}\left(\varpi_{i}\right) \tag{176}
\end{align*}
$$

By (75) and Lemma 4.11, there exist $w, v \in W^{I \backslash\{i\}}$ such that $\mathrm{T}_{w}^{(i)}=l \tilde{\mathrm{C}}$ and $\mathrm{T}_{v}^{(i)}=r \tilde{\mathrm{C}}$. We have $w(u)=l \tilde{C}(u)$ and $v(u)=r \tilde{\mathrm{C}}(u)$ for $u \in[i]$. Likewise, there exist $w^{\prime}, v^{\prime} \in$ $W^{I \backslash\{i-2 m\}}$ such that $\mathrm{T}_{w^{\prime}}^{(i-2 m)}=l \mathrm{C}$ and $\mathrm{T}_{v^{\prime}}^{(i-2 m)}=r \mathrm{C}$. It follows that

$$
\begin{align*}
& \bigcup \mathcal{J}(w)=\{\|i \tilde{\mathrm{C}}(u)\| \mid u \in[i]\}=K_{\tilde{\mathrm{C}}} \sqcup\{\|l \mathrm{C}(u)\| \mid u \in[i]\}=K_{\tilde{\mathrm{C}}} \sqcup \bigcup \mathcal{J}\left(w^{\prime}\right),  \tag{177}\\
& \bigcup \mathcal{J}(v)=\{\|r \tilde{\mathrm{C}}(u)\| \mid u \in[i]\}=K_{\tilde{\mathrm{C}}} \sqcup\{\|r \mathrm{C}(u)\| \mid u \in[i]\}=K_{\tilde{\mathrm{C}}} \sqcup \bigcup \mathcal{J}\left(v^{\prime}\right) .
\end{align*}
$$

We know from Lemmas 5.3 and 5.14 (2) that $\left(v^{\prime}, w^{\prime}\right) \in \operatorname{LS}\left(\varpi_{i-2 m}\right)$ and $\mathcal{J}\left(w^{\prime}\right)=$ $\mathcal{J}\left(v^{\prime}\right)$. Hence $\mathcal{J}(w)=\mathcal{J}(v)$, by (177).

In what follows, we freely identify $w, \mathbf{T}_{w}^{(i)}$, and $\mathcal{M}(w)$ with each other for $w \in$ $W^{I \backslash\{i\}}$. Write $\mathcal{J}\left(\mathbf{T}_{w}^{(i)}\right)=\mathcal{J}(w)$ and $\mathcal{M}\left(\mathrm{T}_{w}^{(i)}\right)=\mathcal{M}(w)$ for $w \in W^{I \backslash\{i\}}$. From what has already been proved, we have $\mathcal{J}(l \tilde{\mathrm{C}})=\mathcal{J}(r \tilde{\mathrm{C}})$ for $\tilde{\mathrm{C}} \in \operatorname{QKN}_{B_{n}}\left(\varpi_{i}\right)$.

Lemma 5.24. If $\tilde{\mathrm{C}} \in \operatorname{QKN}_{B_{n}}\left(\varpi_{i}\right)$, then $(r \tilde{\mathrm{C}}, l \tilde{\mathrm{C}}) \in \operatorname{QLS}\left(\varpi_{i}\right)$.
Proof. Let $\tilde{\mathrm{C}}=\mathrm{C} \cup\{\underbrace{\overline{0}, \ldots, \overline{0}}_{2 m \text { times }}\} \in \mathrm{QKN}_{B_{n}}\left(\varpi_{i}\right)$, with $\mathrm{C} \in \mathrm{KN}_{B_{n}}\left(\varpi_{i-2 m}\right)$. Write $\mathcal{J}(l \tilde{\mathrm{C}})=$ $\mathcal{J}(r \tilde{\mathrm{C}})=\left(J_{1}<\cdots<J_{\mu}\right) \in \mathcal{S}_{i}, \mathcal{J}(l \mathrm{C})=\mathcal{J}(r \mathrm{C})=\left(J_{1}^{\prime}<\cdots<J_{\kappa}^{\prime}\right) \in \mathcal{S}_{i-2 m}$, $\mathcal{M}(l \tilde{\mathrm{C}})=\left(M_{\nu}\right), \mathcal{M}(r \tilde{\mathrm{C}})=\left(N_{\nu}\right) \in \prod_{\nu=1}^{\mu} 2^{J_{\nu}}$, and $\mathcal{M}(l \mathrm{C})=\left(M_{\nu}^{\prime}\right), \mathcal{M}(r \mathrm{C})=\left(N_{\nu}^{\prime}\right) \in$ $\prod_{\nu=1}^{\kappa} 2^{J_{\nu}^{\prime}}$. We know from (177) that $\bigcup_{\nu=1}^{\mu} J_{\nu}=K_{\tilde{\mathrm{C}}} \sqcup \bigcup_{\nu=1}^{\kappa} J_{\nu}^{\prime}$. Recall that $J_{1}$ is a segment. It follows from the definition of $K_{\tilde{\mathrm{C}}}$ that there exists $\tau \in[0, \kappa]$ such that $J_{1}=K_{\tilde{\mathrm{C}}} \sqcup \bigcup_{\nu=1}^{\tau} J_{\nu}^{\prime}, M_{1}=K_{\tilde{\mathrm{C}}} \sqcup \bigcup_{\nu=1}^{\tau} M_{\nu}^{\prime}, N_{1}=\bigcup_{\nu=1}^{\tau} N_{\nu}^{\prime}, J_{\nu}=J_{\nu+\tau-1}^{\prime}$, $M_{\nu}=M_{\nu+\tau-1}^{\prime}, N_{\nu}=N_{\nu+\tau-1}^{\prime}$ for $\nu \in[2, \mu]$, and $\mu+\tau-1=\kappa$.

We first assume that $n \in J_{\tau}^{\prime}\left(\subset J_{1}\right)$. Then $1 \notin J_{1}$ since $J_{1}$ is a segment such that $\# J_{1} \leqslant i<n$. Hence $1 \notin K_{\tilde{\mathrm{C}}}^{\tilde{\mathrm{C}}} \sqcup J_{1}^{\prime}$. By the definition of $K_{\tilde{\mathrm{C}}}$, this implies $K_{\tilde{\mathrm{C}}}=\varnothing$ and $m=0$. It follows that $(r \tilde{\mathrm{C}}, l \tilde{\mathrm{C}})=(r \mathrm{C}, l \mathrm{C}) \in \mathrm{LS}\left(\varpi_{i}\right) \subset \mathrm{QLS}\left(\varpi_{i}\right)$.

We next assume that $n \notin J_{\tau}^{\prime}$ (or equivalently, $n \notin J_{\nu}^{\prime}$ for $\nu \in[\tau]$ ), and show that $\left(M_{\nu}\right) \unlhd\left(N_{\nu}\right)$ in $\prod_{\nu=1}^{\mu} 2^{J_{\nu}}$ (see Definition 5.6 and (128)). Since $(r \mathrm{C}, l \mathrm{C}) \in \mathrm{LS}\left(\varpi_{i-2 m}\right)$, we see from (129) that $M_{\nu}^{\prime} \unlhd^{\prime} N_{\nu}^{\prime}$ in $2^{J_{\nu}^{\prime}}$ for $\nu \in[\kappa]$. In particular, it follows from Definition 5.4, $\{1,2\} \not \subset J_{\nu}, J_{\nu}=J_{\nu+\tau-1}^{\prime}, M_{\nu}=M_{\nu+\tau-1}^{\prime}$, and $N_{\nu}=N_{\nu+\tau-1}^{\prime}$ for $\nu \in[2, \mu]$ that $M_{\nu} \unlhd N_{\nu}$ in $2^{J_{\nu}}$ for $\nu \in[2, \mu]$. Also, $n \notin J_{\tau}^{\prime}$, Lemma 5.5 (1) and (4) yield $\# M_{\nu}^{\prime}=\# N_{\nu}^{\prime}$ for $\nu \in[\tau]$. Since $M_{1}=K_{\tilde{\mathrm{C}}} \sqcup \bigcup_{\nu=1}^{\tau} M_{\nu}^{\prime}$ and $N_{1}=\bigcup_{\nu=1}^{\tau} N_{\nu}^{\prime}$, we have $\# M_{1}-\# N_{1}=\# K_{\tilde{\mathrm{C}}}=2 m \in 2 \mathbb{Z}_{\geqslant 0}$. Write $\bigcup_{\nu=1}^{\tau} M_{\nu}^{\prime}=\left\{m_{1}^{\prime}<m_{2}^{\prime}<\cdots<m_{s}^{\prime}\right\} \subset$ $M_{1}=\left\{m_{1}<m_{2}<\cdots<m_{r}\right\}$ and $N_{1}=\left\{n_{1}<n_{2}<\cdots<n_{s}\right\}$, where $r=s+2 m$. It is clear that $m_{r-\nu} \geqslant m_{s-\nu}^{\prime}$ for $\nu \in[0, s-1]$. Since $M_{\nu}^{\prime} \unlhd^{\prime} N_{\nu}^{\prime}$ in $2^{J_{\nu}^{\prime}}$ for $\nu \in[\tau]$, we have $m_{s-\nu}^{\prime} \geqslant n_{s-\nu}$ for $\nu \in[0, s-1]$, by Lemma 5.5 (1) and (4). Consequently, $m_{r-\nu} \geqslant n_{s-\nu}$ for $\nu \in[0, s-1]$, and hence $M_{1} \unlhd N_{1}$ in $2^{J_{1}}$, by Lemma 5.5 (1) and (4). We conclude that $\left(M_{\nu}\right) \unlhd\left(N_{\nu}\right)$ in $\prod_{\nu=1}^{\mu} 2^{J_{\nu}}$, and so $(r \tilde{\mathrm{C}}, l \tilde{\mathrm{C}}) \in \operatorname{QLS}\left(\varpi_{i}\right)$, by (128).

Lemma 5.25. Let $(v, w) \in \operatorname{QLS}\left(\varpi_{i}\right), \mathcal{J}(w)=\mathcal{J}(v)=\left(J_{1}<\cdots<J_{\mu}\right) \in \mathcal{S}_{i}$, and $\mathcal{M}(w)=\left(M_{\nu}\right), \mathcal{M}(v)=\left(N_{\nu}\right) \in \prod_{\nu=1}^{\mu} 2^{J_{\nu}}$. Write $\left\{y^{1}<y^{2}<\cdots<y^{l}\right\}=N_{1} \backslash M_{1}$. The elements $z^{1}=\min \left\{z \in J_{1} \mid z \succ y^{1}, z \in M_{1} \backslash N_{1}\right\}$ and $z^{\nu}=\min \left\{z \in J_{1} \mid z \succ\right.$ $\left.\max \left\{y^{\nu}, z^{\nu-1}\right\}, z \in M_{1} \backslash N_{1}\right\}, \nu \in[2, l]$, are well-defined (see (i)-(iii) in Theorem 5.16 (2)).

Proof. We see from Lemma 5.5 (1)-(2) and (4) that our assertion follows from ( $M_{1}$ 入 $\left.N_{1}\right) \unlhd\left(N_{1} \backslash M_{1}\right)$ in $2^{J_{1}}$. Write (temporarily) $J_{1}=[p, q]$ and $M_{1} \backslash N_{1}=\left\{w^{1}<w^{2}<\right.$ $\left.\cdots<w^{k}\right\}$.

We first assume that $\left(n \notin J_{1}\right.$ and $\left.\{1,2\} \not \subset J_{1}\right)$ or $\left(n \in J_{1}\right)$. Since $M_{1} \unlhd N_{1}$ by (128), we see from Lemma $5.5(1)-(2)$ that $\#\left(M_{1} \backslash N_{1}\right)-\#\left(N_{1} \backslash M_{1}\right)=\# M_{1}-\# N_{1} \leqslant 0$ and $\#\left(M_{1} \cap[p, w]\right) \leqslant \#\left(N_{1} \cap[p, w]\right)$ for all $w \in J_{1}$. On the contrary, suppose that $\left(M_{1} \backslash N_{1}\right) \nexists\left(N_{1} \backslash M_{1}\right)$ in $2^{J_{1}}$. By Lemma 5.5 (1)-(2), there exists $r \in[k]$ such that $w^{r}<y^{r}$ and $w^{\nu} \geqslant y^{\nu}$ for $\nu \in[r-1]$. This implies $\#\left(M_{1} \cap\left[p, w^{r}\right]\right)-\#\left(N_{1} \cap\left[p, w^{r}\right]\right)=$ $1>0$, a contradiction.

We next assume that $\{1,2\} \subset J_{1}$. Since $M_{1} \unlhd N_{1}$ by (128), we see from Lemma 5.5 (4) that $\#\left(M_{1} \backslash N_{1}\right)-\#\left(N_{1} \backslash M_{1}\right)=\# M_{1}-\# N_{1} \in 2 \mathbb{Z}_{\geqslant 0}$ and $\#\left(M_{1} \cap[y, q]\right) \geqslant \#\left(N_{1} \cap\right.$ $[y, q])$ for all $y \in[p, q]$. On the contrary, suppose that $\left(M_{1} \backslash N_{1}\right) \nexists\left(N_{1} \backslash M_{1}\right)$ in $2^{J_{1}}$. By Lemma 5.5 (4), there exists $r \in[0, l-1]$ such that $w^{k-r}<y^{l-r}$ and $w^{k-\nu} \geqslant y^{l-\nu}$
for $\nu \in[0, r-1]$. This implies $\#\left(M_{1} \cap\left[y^{l-r}, q\right]\right)-\#\left(N_{1} \cap\left[y^{l-r}, q\right]\right)=-1<0$, a contradiction.

Lemma 5.26. Under the hypotheses of Lemma 5.25, set $f=\# N_{\mu}-\# M_{\mu} \in \mathbb{Z}_{\geqslant 0}$ if $n \in J_{\mu}$, and set $f=0$ otherwise. Set $2 m=\# M_{1}-\# N_{1} \in 2 \mathbb{Z}_{\geqslant 0}$ if $1,2 \in J_{1}$, and set $m=0$ otherwise. Then

$$
\begin{align*}
& \tilde{\mathrm{C}}=\left(J_{1} \backslash\left(M_{1} \cup N_{1}\right)\right) \cup\left\{z^{\nu}, \overline{z^{\nu}} \mid \nu \in[l]\right\} \cup\left\{\bar{z} \mid z \in M_{1} \cap N_{1}\right\} \\
& \cup \bigcup_{\nu=2}^{\mu}\left(\left(J_{\nu} \backslash N_{\nu}\right) \cup\left\{\bar{z} \mid z \in M_{\nu}\right\}\right) \cup\{\underbrace{0, \ldots, 0}_{f \text { times }}\} \cup\{\underbrace{\overline{0}, \ldots, \overline{0}}_{2 m \text { times }}\} \tag{178}
\end{align*}
$$

is a QKN $B_{n}$-column of shape $\varpi_{i}($ see (155)).
Proof. It suffices to prove that

$$
\mathrm{C}=\left(J_{1} \backslash\left(M_{1} \cup N_{1}\right)\right) \cup\left\{z^{\nu}, \overline{z^{\nu}} \mid \nu \in[l]\right\} \cup\left\{\bar{z} \mid z \in M_{1} \cap N_{1}\right\}
$$

$$
\begin{equation*}
\cup \bigcup_{\nu=2}^{\mu}\left(\left(J_{\nu} \backslash N_{\nu}\right) \cup\left\{\bar{z} \mid z \in M_{\nu}\right\}\right) \cup\{\underbrace{0, \ldots, 0}_{f \text { times }}\} \tag{179}
\end{equation*}
$$

is a KN $B_{n}$-column of shape $\varpi_{i-2 m}$. It is easily seen that C satisfies (KN-B1)-(KNB2) (see §5.4). By Lemma 5.14 (2), we only need to show that C can be split. We see at once that $I_{\mathrm{C}}=\left\{z^{\nu} \mid \nu \in[l]\right\} \cup \bigcup_{\nu=2}^{\mu}\left(M_{\nu} \backslash N_{\nu}\right) \cup\{\underbrace{0, \ldots, 0}_{f \text { times }}\}$. We show that $J_{\mathrm{C}}$ is given by $\bigcup_{\nu=1}^{\mu}\left(N_{\nu} \backslash M_{\nu}\right)$.

We see that Lemma 5.25 (and (i)-(iii) in Theorem 5.16 (2)) imply
(i) $y^{l}=\max \left\{y \in J_{1} \mid y \prec z^{l}, y \in N_{1} \backslash M_{1}\right\}$,
(ii) $y^{\nu}=\max \left\{y \in J_{1} \mid y \prec \min \left\{y^{\nu+1}, z^{\nu}\right\}, y \in N_{1} \backslash M_{1}\right\}$ for $\nu \in[l-1]$.

It follows from (179) that for $y \in J_{1}$ we have $y \in N_{1} \backslash M_{1}$ if and only if $y \notin \mathrm{C}$ and $\bar{y} \notin \mathrm{C}$. Since $J_{1}$ is a segment, $N_{1} \backslash M_{1} \subset J_{1}$, and $z^{\nu} \in J_{1}$ for $\nu \in[l]$, we can rewrite (i)-(ii) as
(i') $y^{l}=\max \left\{y \in \mathcal{B}_{n} \mid y \prec z^{l}, y \notin \mathrm{C}, \bar{y} \notin \mathrm{C}\right\}$,
(ii') $y^{\nu}=\max \left\{y \in \mathcal{B}_{n} \mid y \prec \min \left\{y^{\nu+1}, z^{\nu}\right\}, y \notin \mathrm{C}, \bar{y} \notin \mathrm{C}\right\}$ for $\nu \in[l-1]$.
Let $\tau \in[2, \mu]$. Write $\left(M_{\mu} \backslash N_{\mu}\right) \cup\{\underbrace{0, \ldots, 0}_{f \text { times }}\}=\left\{z_{1}^{\mu} \succeq z_{2}^{\mu} \succeq \cdots \succeq z_{k}^{\mu}\right\}, M_{\tau} \backslash N_{\tau}=$
$\left\{z_{1}^{\tau}>z_{2}^{\tau}>\cdots>z_{k}^{\tau}\right\}$ if $\tau \neq \mu$, and $N_{\tau} \backslash M_{\tau}=\left\{y_{1}^{\tau}>y_{2}^{\tau}>\cdots>y_{k}^{\tau}\right\}$. Similarly to (i')-(ii'), we can deduce from $N_{\tau} \unrhd M_{\tau}$, Lemmas 5.5 and 5.14 (2) that
( $\tau$-i) $y_{1}^{\tau}=\max \left\{y \in \mathcal{B}_{n} \mid y \prec z_{1}^{\tau}, y \notin \mathrm{C}, \bar{y} \notin \mathrm{C}\right\}$,
$\left(\tau\right.$-ii) $y_{\nu}^{\tau}=\max \left\{y \in \mathcal{B}_{n} \mid y \prec \min \left\{y_{\nu-1}^{\tau}, z_{\nu}^{\tau}\right\}, y \notin \mathrm{C}, \bar{y} \notin \mathrm{C}\right\}$ for $\nu \in[2, k]$.
We conclude from $\# I_{\mathrm{C}}=\# \bigcup_{\nu=1}^{\mu}\left(N_{\nu} \backslash M_{\nu}\right)$, (i')-(ii'), and ( $\tau$-i)-( $\tau$-ii) for $\tau \in[2, \mu]$ that $J_{\mathrm{C}}=\bigcup_{\nu=1}^{\mu}\left(N_{\nu} \backslash M_{\nu}\right)$. This completes the proof.

By Lemmas 5.24-5.26, we obtain the maps $\Phi_{i}: \operatorname{QKN}_{B_{n}}\left(\varpi_{i}\right) \rightarrow \operatorname{QLS}\left(\varpi_{i}\right), \tilde{\mathrm{C}} \mapsto$ $(r \tilde{\mathrm{C}}, l \tilde{\mathrm{C}})$, and $\Psi_{i}: \operatorname{QLS}\left(\varpi_{i}\right) \rightarrow \operatorname{QKN}_{B_{n}}\left(\varpi_{i}\right),(v, w) \mapsto \tilde{\mathrm{C}}$, where $\tilde{\mathrm{C}}$ is defined as $(155)$ or (178).

Lemma 5.27. The maps $\Phi_{i}$ and $\Psi_{i}$ are inverses of each other.
Proof. By Lemma 5.14 (2), the map $\Phi_{i}$ is injective. The proof is completed by showing that $\left(\Phi_{i} \circ \Psi_{i}\right)(v, w)=(v, w)$ for $(v, w) \in \operatorname{QLS}\left(\varpi_{i}\right)$.

Let $(v, w) \in \operatorname{QLS}\left(\varpi_{i}\right)$ and $\mathcal{J}(w)=\mathcal{J}(v)=\left(J_{1}<\cdots<J_{\mu}\right) \in \mathcal{S}_{i}$. If $\{1,2\} \not \subset J_{1}$, then we conclude from Definition 5.4 and (129) that $(v, w) \in \operatorname{LS}\left(\varpi_{i}\right)$, hence that
$\left(\Phi_{i} \circ \Psi_{i}\right)(v, w)=(v, w)$ by Lemma 5.14 (2). Therefore we may and do assume that $\{1,2\} \subset J_{1}$.

Let $\tilde{\mathrm{C}}=\mathrm{C} \cup\{\underbrace{\overline{0}, \ldots, \overline{0}}_{2 m \text { times }}\}=\Psi_{i}(v, w) \in \operatorname{QKN}_{B_{n}}\left(\varpi_{i}\right)$, with $\mathrm{C} \in \mathrm{KN}_{B_{n}}\left(\varpi_{i-2 m}\right)$, and let $(r \tilde{\mathrm{C}}, l \tilde{\mathrm{C}})=\Phi_{i}(\tilde{\mathrm{C}}) \in \operatorname{QLS}\left(\varpi_{i}\right)$. Write $\mathcal{M}(w)=\left(M_{\nu}\right), \mathcal{M}(v)=\left(N_{\nu}\right) \in \prod_{\nu=1}^{\mu} 2^{J_{\nu}}$, $\mathcal{J}(l \tilde{\mathrm{C}})=\mathcal{J}(r \tilde{\mathrm{C}})=\left(\tilde{J}_{1}<\cdots<\tilde{J}_{\tilde{\mu}}\right) \in \mathcal{S}_{i}$, and $\mathcal{M}(l \tilde{\mathrm{C}})=\left(\tilde{M}_{\nu}\right), \mathcal{M}(r \tilde{\mathrm{C}})=\left(\tilde{N}_{\nu}\right) \in$ $\prod_{\nu=1}^{\tilde{\mu}} 2^{\tilde{J}_{\nu}}$. Note that $\tilde{C}$ and $C$ are described by (178)-(179). Our claim is that $(r \tilde{\mathrm{C}}, l \tilde{\mathrm{C}})=(v, w)$. It suffices to show that $\mu=\tilde{\mu}, J_{\nu}=\tilde{J}_{\nu}, M_{\nu}=\tilde{M}_{\nu}$, and $N_{\nu}=\tilde{N}_{\nu}$ for $\nu \in[\mu]$.

We know from (the proof of) Lemma 5.26 that $I_{C}=\left\{z^{\nu} \mid \nu \in[l]\right\} \cup \bigcup_{\nu=2}^{\mu}\left(M_{\nu} \backslash\right.$ $\left.N_{\nu}\right) \cup\{\underbrace{0, \ldots, 0}_{f \text { times }}\}$ and $J_{\mathrm{C}}=\bigcup_{\nu=1}^{\mu}\left(N_{\nu} \backslash M_{\nu}\right)$. By (175)-(176), we have

$$
\begin{equation*}
r \tilde{\mathrm{C}}=\underbrace{K_{\tilde{\mathrm{C}}} \cup\left(J_{1} \backslash\left(M_{1} \cup N_{1}\right)\right) \cup\left\{z^{\nu} \mid \nu \in[l]\right\} \cup\left\{\bar{z} \mid z \in N_{1}\right\}}_{=r \tilde{\mathrm{C}}_{1}} \tag{180}
\end{equation*}
$$

$\cup \bigcup_{\nu=2}^{\mu} \underbrace{\left(\left(J_{\nu} \backslash N_{\nu}\right) \cup\left\{\bar{z} \mid z \in N_{\nu}\right\}\right)}_{=r \tilde{\mathrm{C}}_{\nu}}$,

$$
\begin{align*}
& l \tilde{\mathrm{C}}=\underbrace{\left\{\bar{x} \mid x \in K_{\tilde{\mathrm{C}}}\right\} \cup\left(J_{1} \backslash M_{1}\right) \cup\left\{\overline{z^{\nu}} \mid \nu \in[l]\right\} \cup\left\{\bar{z} \mid z \in M_{1} \cap N_{1}\right\}}_{=l \tilde{\mathrm{C}}_{1}} \\
& \qquad \cup \bigcup_{\nu=2}^{\mu} \underbrace{\left(\left(J_{\nu} \backslash M_{\nu}\right) \cup\left\{\bar{z} \mid z \in M_{\nu}\right\}\right)}_{=l \tilde{\mathrm{C}}_{\nu}} ; \tag{181}
\end{align*}
$$

set $r \tilde{\mathrm{C}}_{1}=K_{\tilde{\mathrm{C}}} \cup\left(J_{1} \backslash\left(M_{1} \cup N_{1}\right)\right) \cup\left\{z^{\nu} \mid \nu \in[l]\right\} \cup\left\{\bar{z} \mid z \in N_{1}\right\}, l \tilde{\mathrm{C}}_{1}=\{\bar{x} \mid x \in$ $\left.K_{\tilde{\mathrm{C}}}\right\} \cup\left(J_{1} \backslash M_{1}\right) \cup\left\{\overline{z^{\nu}} \mid \nu \in[l]\right\} \cup\left\{\bar{z} \mid z \in M_{1} \cap N_{1}\right\}, r \tilde{\mathrm{C}}_{\nu}=\left(J_{\nu} \backslash N_{\nu}\right) \cup\left\{\bar{z} \mid z \in N_{\nu}\right\}$, and $l \tilde{\mathrm{C}}_{\nu}=\left(J_{\nu} \backslash M_{\nu}\right) \cup\left\{\bar{z} \mid z \in M_{\nu}\right\}$ for $\nu \in[2, \mu]$. If we prove that

$$
\begin{equation*}
\left\{\|z\| \mid z \in r \tilde{\mathrm{C}}_{\nu}\right\}=\left\{\|z\| \mid z \in l \tilde{\mathrm{C}}_{\nu}\right\}=J_{\nu} \tag{182}
\end{equation*}
$$

for $\nu \in[\mu]$, then we see at once from $(180)-(181)$ that $\mu=\tilde{\mu}, J_{\nu}=\tilde{J}_{\nu}$ for $\nu \in[\mu]$, $M_{\nu}=\tilde{M}_{\nu}$ for $\nu \in[2, \mu]$, and $N_{\nu}=\tilde{N}_{\nu}$ for $\nu \in[\mu]$; the proof for $M_{1}=\tilde{M}_{1}$ will be given later. By (180)-(181), it is easy to check that (182) holds for $\nu \in[2, \mu]$.

We give the proof only for $\left\{\|z\| \mid z \in l \tilde{\mathrm{C}}_{1}\right\}=J_{1}$; the proof for $\left\{\|z\| \mid z \in r \tilde{\mathrm{C}}_{1}\right\}=J_{1}$ is similar. Note that

$$
\begin{equation*}
\left\{\|z\| \mid z \in l \tilde{\mathrm{C}}_{1}\right\}=K_{\tilde{\mathrm{C}}} \sqcup\left(J_{1} \backslash M_{1}\right) \sqcup\left\{z^{\nu} \mid \nu \in[l]\right\} \sqcup\left(M_{1} \cap N_{1}\right) . \tag{183}
\end{equation*}
$$

It is clear that $\left(J_{1} \backslash M_{1}\right) \sqcup\left\{z^{\nu} \mid \nu \in[l]\right\} \sqcup\left(M_{1} \cap N_{1}\right) \subset J_{1}$. Recall that $J_{1}$ is a segment. Therefore, by the definition of $K_{\tilde{\mathrm{C}}}$, it suffices to show that $\#\left\{\|z\| \mid z \in l \tilde{\mathrm{C}}_{1}\right\}=\# J_{1}$. Since $l=\#\left(N_{1} \backslash M_{1}\right)$ and $\# K_{\tilde{\mathrm{C}}}=\# M_{1}-\# N_{1}$, we have $\# M_{1}=\# K_{\tilde{\mathrm{c}}}+l+\#\left(N_{1} \cap M_{1}\right)$.
From this, $M_{1} \subset J_{1}$, and (183), we conclude that $\#\left\{\|z\| \mid z \in l \widetilde{\mathrm{C}}_{1}\right\}=\# J_{1}$.
It remains to prove that $M_{1}=\tilde{M}_{1}$. We have

$$
\begin{aligned}
\tilde{M}_{1} & =\left\{\|z\| \mid z \in l \tilde{\mathrm{C}}_{1}, z \succeq \bar{n}\right\} \quad \text { (by definition) } \\
& =K_{\tilde{\mathrm{C}}} \sqcup\left\{z^{\nu} \mid \nu \in[l]\right\} \sqcup\left(M_{1} \cap N_{1}\right) \quad \text { (by (181)) } \\
& =M_{1} \quad(\text { by }(182)-(183)) .
\end{aligned}
$$

This completes the proof.
Let $\tilde{\mathrm{C}} \in \operatorname{QKN}_{B_{n}}\left(\varpi_{i}\right), \Phi_{i}(\tilde{\mathrm{C}})=(r \tilde{\mathrm{C}}, l \tilde{\mathrm{C}}) \in \operatorname{QLS}\left(\varpi_{i}\right), \mathcal{J}(l \tilde{\mathrm{C}})=\mathcal{J}(r \tilde{\mathrm{C}})=\left(J_{1}<\cdots<\right.$ $\left.J_{\mu}\right) \in \mathcal{S}_{i}$, and $\mathcal{M}(l \tilde{\mathrm{C}})=\left(M_{\nu}\right), \mathcal{M}(r \tilde{\mathrm{C}})=\left(N_{\nu}\right) \in \prod_{\nu=1}^{\mu} 2^{J_{\nu}}$. We continue to use the notation $r \tilde{\mathrm{C}}_{\nu}, l \tilde{\mathrm{C}}_{\nu}, \nu \in[\mu]$, in (180)-(181). We see from (128)-(129) that $\left(r \tilde{\mathrm{C}}_{1}, l \tilde{\mathrm{C}}_{1}\right) \in$
$\operatorname{QLS}\left(\varpi_{\# J_{1}}\right)$ and $\left(r \tilde{\mathrm{C}}_{\nu}, l \tilde{\mathrm{C}}_{\nu}\right) \in \operatorname{LS}\left(\varpi_{\# J_{\nu}}\right)$ for $\nu \in[2, \mu]$. Write $\tilde{\mathrm{C}}_{1}=\Psi_{\# J_{1}}\left(r \tilde{\mathrm{C}}_{1}, l \tilde{\mathrm{C}}_{1}\right) \in$ $\operatorname{QKN}_{B_{n}}\left(\varpi_{\# J_{1}}\right)$ and $\tilde{\mathrm{C}}_{\nu}=\Psi_{\# J_{\nu}}\left(r \tilde{\mathrm{C}}_{\nu}, l \tilde{\mathrm{C}}_{\nu}\right) \in \mathrm{KN}_{B_{n}}\left(\varpi_{\# J_{\nu}}\right)$ for $\nu \in[2, \mu]$. It follows from (the proofs of) Lemmas 5.26-5.27 that

$$
\begin{equation*}
\tilde{\mathrm{C}}=\Psi_{i}(r \tilde{\mathrm{C}}, l \tilde{\mathrm{C}})=\bigsqcup_{\nu=1}^{\mu} \Psi_{\# J_{\nu}}\left(r \tilde{\mathrm{C}}_{\nu}, l \tilde{\mathrm{C}}_{\nu}\right)=\bigsqcup_{\nu=1}^{\mu} \tilde{\mathrm{C}}_{\nu} \tag{184}
\end{equation*}
$$

Set $p_{\nu}=\min J_{\nu}$ and $J_{\nu}^{*}=J_{\nu} \cup\left\{p_{\nu}-1\right\} \subset I_{\mathrm{af}}$ for $\nu \in[\mu]$.
Lemma 5.28. With the notation above, we have

$$
f_{j} \tilde{\mathrm{C}}= \begin{cases}f_{0} \tilde{\mathrm{C}}_{1} \sqcup \bigsqcup_{\nu \in[2, \mu]} \tilde{\mathrm{C}}_{\nu} & \text { if } j=0 \text { and } f_{0} \tilde{\mathrm{C}}_{1} \neq \mathbf{0},  \tag{185}\\ f_{j} \tilde{\mathrm{C}}_{\tau} \sqcup \bigsqcup_{\nu \in[\mu] \backslash\{\tau\}} \tilde{\mathrm{C}}_{\nu} & \text { if } j \in J_{\tau}^{*} \backslash\{0\} \text { and } f_{j} \tilde{\mathrm{C}}_{\tau} \neq \mathbf{0} \text { for some } \tau \in[\mu], \\ \mathbf{0} & \text { otherwise. }\end{cases}
$$

Proof. The assertion for $j \in I$ is immediate from the definition of $f_{j}$ (see (133)-(136) and (145)). Assume that $j=0$, and show that $f_{0} \tilde{\mathrm{C}}$ is determined from $\tilde{\mathrm{C}}_{1}$ (and $J_{1}$ ). We follow the notation in (150)-(152).

If $m=0$ and $y_{k} \notin\{1,2\}$, then $f_{0} \tilde{\mathrm{C}}$ is determined from $\tilde{\mathrm{C}} \cap\{1,2, \overline{2}, \overline{1}\}$ (see (150)). We see from (184) that $\tilde{\mathrm{C}} \cap\{1,2, \overline{2}, \overline{1}\} \subset \tilde{\mathrm{C}}_{1}$. Hence the assertion follows.

If $m>0$ and $y_{k} \notin\{1,2\}$, then $f_{0} \tilde{\mathrm{C}}$ is determined from $\tilde{\mathrm{C}} \cap\{1,2, \overline{2}, \overline{1}\}$ and $x_{2}$ (see (151)). Since $\tilde{\mathrm{C}} \cap\{1,2, \overline{2}, \overline{1}\} \subset \tilde{\mathrm{C}}_{1}$ and $x_{2} \in K_{\tilde{\mathrm{C}}}^{\tilde{\mathrm{C}}}{ } \subset J_{1}$, the assertion follows.

If $y_{k} \in\{1,2\}$, then $f_{0} \tilde{\mathrm{C}}$ is determined from $\tilde{\mathrm{C}} \cap\{1,2, \overline{2}, \overline{1}\}$ and $z_{k}$ (see (152)). Since $\tilde{\mathrm{C}} \cap\{1,2, \overline{2}, \overline{1}\} \subset \tilde{\mathrm{C}}_{1}$, it follows that $y_{k} \in J_{1}$, hence that $z_{k} \in J_{1}$ by the proof of Lemma 5.26 , and the assertion follows.

Let $\eta=(v, w) \in \operatorname{QLS}\left(\varpi_{i}\right)$ and $j \in I_{\mathrm{af}}$. Recall from (31)-(32) that

$$
\bar{\eta}(t)= \begin{cases}t v \varpi_{i} & \text { for } 0 \leqslant t \leqslant \frac{1}{2} \\ \frac{1}{2} v \varpi_{i}+\left(t-\frac{1}{2}\right) w^{2} \varpi_{i} & \text { for } \frac{1}{2} \leqslant t \leqslant 1\end{cases}
$$

and $h_{j}^{\eta}(t)=\left\langle\alpha_{j}^{\vee}, \bar{\eta}(t)\right\rangle$ for $0 \leqslant t \leqslant 1$; note that the function $h_{j}^{\eta}(t)$ is uniquely determined from $\left\langle\alpha_{j}^{\vee}, v \varpi_{i}\right\rangle$ and $\left\langle\alpha_{j}^{\vee}, w \varpi_{i}\right\rangle$. We see from (35)-(36) that $f_{j}(v, w)$ is determined from $h_{j}^{\eta}(t)$. Consequently, $f_{j}(v, w) \in\left\{\mathbf{0},\left(r_{j} v, w\right),\left(v, r_{j} w\right),\left(r_{j} v, r_{j} w\right)\right\}$ is determined from $\left\langle\alpha_{j}^{\vee}, v \varpi_{i}\right\rangle,\left\langle\alpha_{j}^{\vee}, w \varpi_{i}\right\rangle \in\{-2,-1,0,1,2\}$. Note that $h_{j}^{\eta}(1)$ is an integer. We know from [25, Proposition 4.1.12] that all local minima of $h_{j}^{\eta}(t)$ are integers. Hence $\left(\left\langle\alpha_{j}^{\vee}, v \varpi_{i}\right\rangle,\left\langle\alpha_{j}^{\vee}, w \varpi_{i}\right\rangle\right)$ is neither $(-2,-1),(-2,1),(-1,-2)$, $(-1,0),(-1,1),(-1,2),(0,-1),(0,1),(1,-2),(1,0),(1,2),(2,-1)$, nor $(2,1)$. It follows that

$$
f_{j}(v, w)= \begin{cases}\left(r_{j} v, w\right) & \text { if }\left(\left\langle\alpha_{j}^{\vee}, v \varpi_{i}\right\rangle,\left\langle\alpha_{j}^{\vee}, w \varpi_{i}\right\rangle\right) \in\{(2,0),(2,2)\},  \tag{186}\\ \left(v, r_{j} w\right) & \text { if }\left(\left\langle\alpha_{j}^{\vee}, v \varpi_{i}\right\rangle,\left\langle\alpha_{j}^{\vee}, w \varpi_{i}\right\rangle\right) \in\{(-2,2),(0,2)\}, \\ \left(r_{j} v, r_{j} w\right) & \text { if }\left(\left\langle\alpha_{j}^{\vee}, v \varpi_{i}\right\rangle,\left\langle\alpha_{j}^{\vee}, w \varpi_{i}\right\rangle\right)=(1,1),\end{cases}
$$

and $f_{j}(v, w)=\mathbf{0}$ if $\left(\left\langle\alpha_{j}^{\vee}, v \varpi_{i}\right\rangle,\left\langle\alpha_{j}^{\vee}, w \varpi_{i}\right\rangle\right)$ is either

$$
\begin{equation*}
(-2,-2),(-2,0),(-1,-1),(0,-2),(0,0),(1,-1), \text { or }(2,-2) \tag{187}
\end{equation*}
$$

We now give a restatement of (186)-(187) in terms of tableaux. Let $(r \tilde{\mathrm{C}}, l \tilde{\mathrm{C}}) \in$ $\operatorname{QLS}\left(\varpi_{i}\right)$. Recall that $W_{\text {af }}$ acts on $\mathcal{C}_{n} \cong\left\{ \pm \varepsilon_{s} \mid s \in[n]\right\}$ by $W_{\text {af }} \rightarrow \mathfrak{S}\left(\mathcal{C}_{n}\right), r_{0} \mapsto$ $(1 \overline{2})(\overline{1} 2), r_{j} \mapsto(j j+1)(\bar{j} \overline{j+1})$ for $j \in[n-1]$, and $r_{n} \mapsto(n \bar{n})$.

We first assume that $j \in[n-1]$. Write $[l \tilde{\mathrm{C}}]_{j}=l \tilde{\mathrm{C}} \cap\{j, j+1, \overline{j+1}, \bar{j}\}$ and $[r \tilde{\mathrm{C}}]_{j}=r \tilde{\mathrm{C}} \cap$ $\{j, j+1, \overline{j+1}, \bar{j}\}$. If $[r \tilde{\mathrm{C}}]_{j}$ (resp. $\left.[l \tilde{\mathrm{C}}]_{j}\right) \in\{\{j\},\{j, \overline{j+1}\}\}$, then define $r_{j} r \tilde{\mathrm{C}}$ (resp. $r_{j} l \tilde{\mathrm{C}}$ ) $\in \operatorname{CST}_{B_{n}}\left(\varpi_{i}\right)$ to be such that $\left(r_{j} r \tilde{\mathrm{C}}\right)(u)=r_{j}(r \tilde{\mathrm{C}}(u))\left(\right.$ resp. $\left.\left(r_{j} l \tilde{\mathrm{C}}\right)(u)=r_{j}(l \tilde{\mathrm{C}}(u))\right)$ for $u \in[i]$. Recall that $\alpha_{j}^{\vee}=\varepsilon_{j}-\varepsilon_{j+1}$. Since $\varpi_{i}=\sum_{s=1}^{i} \varepsilon_{s}$, we have $w \varpi_{i}=\sum_{u=1}^{i} \varepsilon_{l \mathrm{C}(u)}$ and $v \varpi_{i}=\sum_{u=1}^{i} \varepsilon_{r \mathrm{C}(u)}$; we understand that $\varepsilon_{\bar{s}}=-\varepsilon_{s}$ for $s \in[n]$. Hence we can rewrite (186)-(187) as

$$
f_{j}(r \tilde{\mathrm{C}}, l \tilde{\mathrm{C}})= \begin{cases}\left(r_{j} r \tilde{\mathrm{C}}, l \tilde{\mathrm{C}}\right) & \text { if }[r \tilde{\mathrm{C}}]_{j}=\{j, \overline{j+1}\}  \tag{188}\\ & \text { and }[l \tilde{\mathrm{C}}]_{j} \in\{\{j, j+1\},\{j, \overline{j+1}\},\{\bar{j}, \overline{j+1}\}\} \\ \left(r \tilde{\mathrm{C}}, r_{j} l \tilde{\mathrm{C}}\right) & \text { if }[r \tilde{\mathrm{C}}]_{j} \in\{\{j, j+1\},\{\bar{j}, j+1\},\{\bar{j}, \overline{j+1}\}\} \\ & \text { and }[l \tilde{\mathrm{C}}]_{j}=\{j, \overline{j+1}\}, \\ \left(r_{j} r \tilde{\mathrm{C}}, r_{j} l \tilde{\mathrm{C}}\right) \quad & \text { if }[r \tilde{\mathrm{C}}]_{j}=[l \tilde{\mathrm{C}}]_{j} \in\{\{j\},\{\overline{j+1}\}\},\end{cases}
$$

and $f_{j}(r \tilde{\mathrm{C}}, l \tilde{\mathrm{C}})=\mathbf{0}$ if $\left([r \tilde{\mathrm{C}}]_{j},[l \tilde{\mathrm{C}}]_{j}\right)$ is either

$$
\begin{aligned}
& (\{j+1, \bar{j}\},\{j+1, \bar{j}\}),(\{j+1, \bar{j}\},\{j, j+1\}),(\{j+1, \bar{j}\},\{\overline{j+1}, \bar{j}\}), \\
& (\{\bar{j}\},\{\bar{j}\}),(\{j+1\},\{j+1\}),(\{j, j+1\},\{j+1, \bar{j}\}), \\
& (\{\overline{j+1}, \bar{j}\},\{j+1, \bar{j}\}),(\varnothing, \varnothing),(\{j, j+1\},\{j, j+1\}), \\
& (\{j, j+1\},\{\overline{j+1}, \bar{j}\}),(\{\overline{j+1}, \bar{j}\},\{j, j+1\}),(\{\overline{j+1}, \bar{j}\},\{\overline{j+1}, \bar{j}\}), \\
& (\{j\},\{\bar{j}\}),(\{\overline{j+1}\},\{j+1\}), \text { or }(\{j, \overline{j+1}\},\{j+1, \bar{j}\}) .
\end{aligned}
$$

We next assume that $j=n$. Write $[l \tilde{\mathrm{C}}]_{n}=l \tilde{\mathrm{C}} \cap\{n, \bar{n}\}$ and $[r \tilde{\mathrm{C}}]_{n}=r \tilde{\mathrm{C}} \cap\{n, \bar{n}\}$. If $[r \tilde{\mathrm{C}}]_{n}$ (resp. $\left.[l \tilde{\mathrm{C}}]_{n}\right) \in\{n\}$, then define $r_{n} r \tilde{\mathrm{C}}\left(\right.$ resp. $\left.r_{n} l \tilde{\mathrm{C}}\right) \in \operatorname{CST}_{B_{n}}\left(\varpi_{i}\right)$ to be such that $\left(r_{n} r \tilde{\mathrm{C}}\right)(u)=r_{n}(r \tilde{\mathrm{C}}(u))\left(\right.$ resp. $\left.\left(r_{n} l \tilde{\mathrm{C}}\right)(u)=r_{n}(l \tilde{\mathrm{C}}(u))\right)$ for $u \in[i]$. Note that $\alpha_{n}^{\vee}=2 \varepsilon_{n}$. Similarly to (188)-(189), we have

$$
f_{n}(r \tilde{\mathrm{C}}, l \tilde{\mathrm{C}})= \begin{cases}\left(r_{n} r \tilde{\mathrm{C}}, l \tilde{\mathrm{C}}\right) & \text { if }[r \tilde{\mathrm{C}}]_{n}=[l \tilde{\mathrm{C}}]_{n}=\{n\}  \tag{190}\\ \left(r \tilde{\mathrm{C}}, r_{n} l \tilde{\mathrm{C}}\right) & \text { if }[r \tilde{\mathrm{C}}]_{n}=\{\bar{n}\} \text { and }[l \tilde{\mathrm{C}}]_{n}=\{n\}, \\ \mathbf{0} & \text { if }\left([r \tilde{\mathrm{C}}]_{n},[l \tilde{\mathrm{C}}]_{n}\right) \in\{(\varnothing, \varnothing),(\{n\},\{\bar{n}\}),(\{\bar{n}\},\{\bar{n}\})\}\end{cases}
$$

We finally assume that ${\underset{\tilde{C}}{ }}_{j}=0$. Write $[l \tilde{C}]_{0}=l \tilde{\mathrm{C}} \cap\{1,2, \overline{2}, \overline{1}\}$ and $[r \tilde{\mathrm{C}}]_{0}=r \tilde{\mathrm{C}} \cap$ $\{1,2, \overline{2}, \overline{1}\}$. If $[r \tilde{\mathrm{C}}]_{0}\left(\right.$ resp. $\left.[l \tilde{\mathrm{C}}]_{0}\right) \in\{\{\overline{2}\},\{\overline{1}\},\{\overline{2}, \overline{1}\}\}$, then define $r_{0} r \tilde{\mathrm{C}}$ (resp. $\left.r_{0} l \tilde{\mathrm{C}}\right) \in$ $\operatorname{CST}_{B_{n}}\left(\varpi_{i}\right)$ to be such that $\left(r_{0} r \tilde{\mathrm{C}}\right)(u)=r_{0}(r \tilde{\mathrm{C}}(u))\left(\right.$ resp. $\left.\left(r_{0} l \tilde{\mathrm{C}}\right)(u)=r_{0}(l \tilde{\mathrm{C}}(u))\right)$ for $u \in[i]$. Note that $\theta^{\vee}=\varepsilon_{1}+\varepsilon_{2}$ and $\left\langle\alpha_{0}^{\vee}, \lambda\right\rangle=\left\langle-\theta^{\vee}, \lambda\right\rangle=-\left\langle\varepsilon_{1}+\varepsilon_{2}, \lambda\right\rangle$ for $\lambda \in P$. Similarly to (188)-(189), we have

$$
f_{0}(r \tilde{\mathrm{C}}, l \tilde{\mathrm{C}})= \begin{cases}\left(r_{0} r \tilde{\mathrm{C}}, l \tilde{\mathrm{C}}\right) & \text { if }[r \tilde{\mathrm{C}}]_{0}=\{\overline{2}, \overline{1}\} \text { and }[l \tilde{\mathrm{C}}]_{0} \in\{\{1, \overline{2}\},\{2, \overline{1}\},\{\overline{2}, \overline{1}\}\},  \tag{191}\\ \left(r \tilde{\mathrm{C}}, r_{0} l \tilde{\mathrm{C}}\right) & \text { if }[r \tilde{\mathrm{C}}]_{0} \in\{\{1,2\},\{1, \overline{2}\},\{2, \overline{1}\}\} \text { and }[l \tilde{\mathrm{C}}]_{0}=\{\overline{2}, \overline{1}\}, \\ \left(r_{0} r \tilde{\mathrm{C}}, r_{0} l \tilde{\mathrm{C}}\right) & \text { if }[r \tilde{\mathrm{C}}]_{0}=[l \tilde{\mathrm{C}}]_{0} \in\{\{\overline{1}\},\{\overline{2}\}\},\end{cases}
$$

and $f_{0}(r \tilde{\mathrm{C}}, l \tilde{\mathrm{C}})=\mathbf{0}$ if $\left([r \tilde{\mathrm{C}}]_{0},[l \tilde{\mathrm{C}}]_{0}\right)$ is either

$$
\begin{align*}
& (\{1,2\},\{1,2\}),(\{1,2\},\{1, \overline{2}\}),(\{1,2\},\{2, \overline{1}\}),(\{1\},\{1\}),(\{2\},\{2\}) \\
& (\{1, \overline{2}\},\{1,2\}),(\{2, \overline{1}\},\{1,2\}),(\varnothing, \varnothing),(\{2, \overline{1}\},\{2, \overline{1}\}),(\{2, \overline{1}\},\{1, \overline{2}\})  \tag{192}\\
& (\{1, \overline{2}\},\{2, \overline{1}\}),(\{1, \overline{2}\},\{1, \overline{2}\}),(\{\overline{1}\},\{1\}),(\{\overline{2}\},\{2\}), \text { or }(\{\overline{2}, \overline{1}\},\{1,2\})
\end{align*}
$$

Lemma 5.29. Keep the notation above. If $f_{j}\left(r \tilde{\mathrm{C}}_{\tau}, l \tilde{\mathrm{C}}_{\tau}\right) \neq \mathbf{0}$ for some $j \in I$ and $\tau \in[\mu]$, then $j \in J_{\tau}^{*}$. If $f_{0}\left(r \tilde{\mathrm{C}}_{\tau}, l \tilde{\mathrm{C}}_{\tau}\right) \neq \mathbf{0}$ for some $\tau \in[\mu]$, then $\tau=1$. In these cases, write
$\left(r \tilde{\mathrm{C}}_{\tau}^{\prime}, l \tilde{\mathrm{C}}_{\tau}^{\prime}\right)=f_{j}\left(r \tilde{\mathrm{C}}_{\tau}, l \tilde{\mathrm{C}}_{\tau}\right) \in \operatorname{QLS}\left(\varpi_{\# J_{\tau}}\right)$. For $j \in I_{\mathrm{af}}$, we have

$$
\begin{equation*}
f_{j}(r \tilde{\mathrm{C}}, l \tilde{\mathrm{C}})=\left(r \tilde{\mathrm{C}}_{\tau}^{\prime} \sqcup \bigsqcup_{\nu \in[\mu] \backslash\{\tau\}} r \tilde{\mathrm{C}}_{\nu}, l \tilde{\mathrm{C}}_{\tau}^{\prime} \sqcup \bigsqcup_{\nu \in[\mu] \backslash\{\tau\}} l \tilde{\mathrm{C}}_{\nu}\right) \tag{193}
\end{equation*}
$$

if $f_{j}\left(r \tilde{\mathrm{C}}_{\tau}, l \tilde{\mathrm{C}}_{\tau}\right) \neq \mathbf{0}$ for some $\tau \in[\mu]$, and $f_{j}(r \tilde{\mathrm{C}}, l \tilde{\mathrm{C}})=\mathbf{0}$ otherwise.
Proof. First part follows immediately from (188)-(192). For (193), we give the proof only for the case that $j \in J_{\tau}^{*} \backslash\{0, n\}, r \tilde{\mathrm{C}}_{\tau} \cap\{j, j+1, \overline{j+1}, \bar{j}\}=l \tilde{\mathrm{C}}_{\tau} \cap\{j, j+1, \overline{j+1}, \bar{j}\}=$ $\{j\}$, and $\left(r \tilde{\mathrm{C}}_{\tau}^{\prime}, l \tilde{\mathrm{C}}_{\tau}^{\prime}\right)=f_{j}\left(r \tilde{\mathrm{C}}_{\tau}, l \tilde{\mathrm{C}}_{\tau}\right)=\left(r_{j} r \tilde{\mathrm{C}}_{\tau}, r_{j} l \tilde{\mathrm{C}}_{\tau}\right) \neq \mathbf{0}$ for some $\tau \in[\mu]$ (see (188)); the proofs for the other cases are similar. It follows from $\left(J_{1}<\cdots<J_{\mu}\right) \in \mathcal{S}_{i}$ and (180)-(181) that $[r \tilde{\mathrm{C}}]_{j}=[l \tilde{\mathrm{C}}]_{j}=\{j\}$. By (188), $f_{j}(r \tilde{\mathrm{C}}, l \tilde{\mathrm{C}})=\left(r_{j} r \tilde{\mathrm{C}}, r_{j} l \tilde{\mathrm{C}}\right)$. Since $r_{j} r \tilde{\mathrm{C}}_{\nu}=r \tilde{\mathrm{C}}_{\nu}$ and $r_{j} l \tilde{\mathrm{C}}_{\nu}=l \tilde{\mathrm{C}}_{\nu}$ for $\nu \in[\mu] \backslash\{\tau\}$, we have $r_{j} r \tilde{\mathrm{C}}=r_{j} r \tilde{\mathrm{C}}_{\tau} \sqcup \bigsqcup_{\nu \in[\mu] \backslash\{\tau\}} r \tilde{\mathrm{C}}_{\nu}$ and $r_{j} l \tilde{\mathrm{C}}=r_{j} l \tilde{\mathrm{C}}_{\tau} \sqcup \bigsqcup_{\nu \in[\mu] \backslash\{\tau\}} l \tilde{\mathrm{C}}_{\nu}$, which is the desired conclusion.
LEMMA 5.30. $\mathrm{QKN}_{B_{n}}\left(\varpi_{i}\right)$ is a $\mathbf{U}^{\prime}$-crystal, and the map $\Phi_{i}$ is a morphism of $\mathbf{U}^{\prime}$ crystals.
Proof. We need to show that the set $\mathrm{QKN}_{B_{n}}\left(\varpi_{i}\right) \sqcup\{\mathbf{0}\}$ is stable under the maps $e_{j}, f_{j}$, $j \in I_{\mathrm{af}}$, and that the map $\Phi_{i}$ satisfies the conditions $(\mathrm{CM} 2)-(\mathrm{CM} 3)$ in $\S 2.2$. We give the proof only for the equality $\Phi_{i}\left(f_{j} \tilde{\mathrm{C}}\right)=f_{j} \Phi_{i}(\tilde{\mathrm{C}})$ for $\tilde{\mathrm{C}}=\mathrm{C} \cup\{\underbrace{\overline{0}, \ldots, \overline{0}}_{2 m \text { times }}\} \in \mathrm{QKN}_{B_{n}}\left(\varpi_{i}\right)$ and $j \in I_{\mathrm{af}}$, where we understand that $\Phi_{i}(\mathbf{0})=\mathbf{0}$ and $f_{j} \mathbf{0}=\mathbf{0}$; the other statements are left to the reader.

We continue to use the notation above. If $j \neq 0$ and $j \notin J_{\tau}^{*}$ for all $\tau \in[\mu]$, then $\Phi_{i}\left(f_{j} \tilde{\mathrm{C}}\right)=\mathbf{0}=f_{j} \Phi_{i}(\tilde{\mathrm{C}})$ by Lemmas $5.28-5.29$ (see also (133)-(136) and (145)). If $j \in J_{\tau}^{*}$ for some $\tau \in[2, \mu]$, then $f_{j} \tilde{\mathrm{C}}_{\tau}=\Psi_{\# J_{\tau}}\left(f_{j} \Phi_{\# J_{\tau}}\left(\tilde{\mathrm{C}}_{\tau}\right)\right)$ by $\tilde{\mathrm{C}}_{\tau} \in \mathrm{KN}_{B_{n}}\left(\varpi_{\# J_{\tau}}\right)$ and Lemma 5.14 (2), and hence $f_{j} \tilde{\mathrm{C}}=\Psi_{i}\left(f_{j} \Phi_{i}(\tilde{\mathrm{C}})\right)$ by (184) and Lemmas 5.285.29, which implies $\Phi_{i}\left(f_{j} \tilde{\mathrm{C}}\right)=f_{j} \Phi_{i}(\tilde{\mathrm{C}})$, by Lemma 5.27 . It remains to prove the assertion for $j \in J_{1}^{*} \cup\{0\}$. By (184) and Lemmas 5.28-5.29, it suffices to show that $\Phi_{\# J_{1}}\left(f_{j} \tilde{\mathrm{C}}_{1}\right)=f_{j} \Phi_{\# J_{1}}\left(\tilde{\mathrm{C}}_{1}\right)$. Therefore there is no loss of generality in assuming that $\mu=1, J_{1}=\left[p_{1}, p_{1}+i-1\right], \tilde{\mathrm{C}}=\tilde{\mathrm{C}}_{1}$, and $j \in J_{1}^{*} \cup\{0\}$.

We first assume that $j \neq 0$. If $p_{1} \geqslant 2$, then $m=0, \tilde{\mathrm{C}}=\mathrm{C} \in \mathrm{KN}_{B_{n}}\left(\varpi_{i}\right)$, and the assertion follows from Lemma 5.14 (2). Therefore we can assume that $p_{1}=1$ and $J_{1}=[i]$. In particular, $j \neq n$ and

$$
\begin{equation*}
\{j, j+1\} \cap[i] \subset I_{\mathrm{C}} \sqcup J_{\mathrm{C}} \sqcup K_{\tilde{\mathrm{C}}} \sqcup(\underbrace{\{\|\mathrm{C}(u)\| \mid u \in[i-2 m]\} \backslash I_{\mathrm{C}}}_{=\|\mathrm{C}\| \backslash I_{\mathrm{C}}}) ; \tag{194}
\end{equation*}
$$

for simplicity of notation, we write $\|\mathrm{C}\| \backslash I_{\mathrm{C}}=\{\|\mathrm{C}(u)\| \mid u \in[i-2 m]\} \backslash I_{\mathrm{C}}$. Recall that $[\tilde{\mathrm{C}}]_{j}=\tilde{\mathrm{C}} \cap\{j, j+1, \overline{j+1}, \bar{j}\},[l \tilde{\mathrm{C}}]_{j}=l \tilde{\mathrm{C}} \cap\{j, j+1, \overline{j+1}, \bar{j}\}$, and $[r \tilde{\mathrm{C}}]_{j}=r \tilde{\mathrm{C}} \cap$ $\{j, j+1, \overline{j+1}, \bar{j}\}$. It follows from $\{\|l \tilde{\mathrm{C}}(u)\| \mid u \in[i]\}=\{\|r \tilde{\mathrm{C}}(u)\| \mid u \in[i]\}=J_{1}=[i]$ that $\left\{\|u\| \mid u \in[l \tilde{\mathrm{C}}]_{j}\right\}=\left\{\|u\| \mid u \in[r \tilde{\tilde{C}}]_{j}\right\} \in\{\{j\},\{j, j+1\}\}$. If $f_{j} \tilde{\mathrm{C}} \neq \mathbf{0}$, then we write $f_{j} \tilde{\mathrm{C}}=\mathrm{C}^{\prime} \cup\{\overline{0}, \ldots, \overline{0}\}$ and $\Phi_{i}\left(f_{j} \tilde{\mathrm{C}}\right)=\left(r f_{j} \tilde{\mathrm{C}}, l f_{j} \tilde{\mathrm{C}}\right)$; recall from (175)-(176) that

$$
\begin{align*}
r f_{j} \tilde{\mathrm{C}} & =K_{f_{j} \mathrm{C}} \cup\left(\mathrm{C}^{\prime} \backslash\left\{\sigma(z) \mid z \in I_{\mathrm{C}^{\prime}}\right\}\right) \cup\left\{\sigma(y) \mid y \in J_{\mathrm{C}^{\prime}}\right\},  \tag{195}\\
l f_{j} \tilde{\mathrm{C}} & =\left\{\bar{x} \mid x \in K_{f_{j}} \tilde{\mathrm{C}}\right\} \cup\left(\mathrm{C}^{\prime} \backslash I_{\mathrm{C}^{\prime}}\right) \cup J_{\mathrm{C}^{\prime}} .
\end{align*}
$$

If $f_{j}(r \underset{\tilde{C}}{\tilde{\mathrm{C}}}, l \tilde{\mathrm{C}}) \neq \mathbf{0}$, then we write $\left(r \tilde{\mathrm{C}}^{\prime}, l \tilde{\mathrm{C}}^{\prime}\right)=f_{j}(r \tilde{\mathrm{C}}, l \tilde{\mathrm{C}}),\left[l \tilde{\mathrm{C}}^{\prime}\right]_{j}=l \tilde{\mathrm{C}}^{\prime} \cap\{j, j+1, \overline{j+1}, \bar{j}\}$, and $\left[r \tilde{\mathrm{C}}^{\prime}\right]_{j}=r \tilde{\mathrm{C}}^{\prime} \cap\{j, j+1, \overline{j+1}, \bar{j}\}$.

Since $[\tilde{\mathrm{C}}]_{j} \subset\{j, j+1, \overline{j+1}, \bar{j}\}$, we have the following sixteen cases.
Case 1. Assume that $[\tilde{\mathrm{C}}]_{j}=\varnothing$. By (133)-(136), $f_{j} \tilde{\mathrm{C}}=\mathbf{0}$. It follows from $[\tilde{\mathrm{C}}]_{j}=\varnothing$ and (194) that $\left(j=i \in K_{\tilde{\mathrm{C}}}\right),\left(j, j+1 \in K_{\tilde{\mathrm{C}}}\right)$, or $\left(j \in K_{\tilde{\mathrm{C}}}\right.$ and $\left.j+1 \in J_{\mathrm{C}}\right)$, hence that
$\left([r \tilde{C}]_{j},[l \tilde{\mathrm{C}}]_{j}\right)$ is either $(\{j\},\{\bar{j}\}),(\{j, j+1\},\{\overline{j+1}, \bar{j}\})$, or $(\{j, \overline{j+1}\},\{j+1, \bar{j}\})$. By (189), $f_{j}(r \tilde{\mathrm{C}}, l \tilde{\mathrm{C}})=\mathbf{0}$.

Case 2. Assume that $[\tilde{\mathrm{C}}]_{j}=\{j\}$. By (133), $f_{j} \tilde{\mathrm{C}}=(\tilde{\mathrm{C}} \backslash\{j\}) \sqcup\{j+1\}$. It follows from $[\tilde{\mathrm{C}}]_{j}=\{j\}$ and (194) that $j \in\|\mathrm{C}\| \backslash I_{\mathrm{C}}$, and that $(j=i),\left(j+1 \in K_{\tilde{\mathrm{C}}}\right)$, or $\left(j+1 \in J_{\mathrm{C}}\right)$, hence that $\left([r \tilde{\mathrm{C}}]_{j},[l \tilde{\mathrm{C}}]_{j}\right)$ is either $(\{j\},\{j\}),(\{j, j+1\},\{j, \overline{j+1}\})$, or $(\{j, \overline{j+1}\},\{j, j+\underset{\sim}{1}\})$.

If $j=i$ and $\left([r \tilde{\mathrm{C}}]_{j},[l \tilde{\mathrm{C}}]_{j}\right)=(\{j\},\{j\})$, then $\left(\left[r \tilde{\mathrm{C}}^{\prime}\right]_{j},\left[l \tilde{\mathrm{C}}^{\prime}\right]_{j}\right)=(\{j+1\},\{j+1\})$, by (188). It follows from $f_{j} \tilde{\mathrm{C}}=(\tilde{\mathrm{C}} \backslash\{j\}) \sqcup\{j+1\}$ that $\mathrm{C}^{\prime}=(\mathrm{C} \backslash\{j\}) \sqcup\{j+1\}, I_{\mathrm{C}^{\prime}}=I_{\mathrm{C}}$, $J_{\mathrm{C}^{\prime}}=J_{\mathrm{C}}$, and $K_{f_{j} \tilde{\mathrm{c}}}=K_{\tilde{\mathrm{C}}}$; note that $\mathcal{J}\left(r f_{j} \tilde{\mathrm{C}}\right)=\mathcal{J}\left(l f_{j} \tilde{\mathrm{C}}\right)=([i-1]<\{i+1\})$. By (195), $\Phi_{i}\left(f_{j} \tilde{\mathrm{C}}\right)=\left(r \tilde{\mathrm{C}}^{\prime}, l \tilde{\mathrm{C}}^{\prime}\right)$.

If $j+1 \in K_{\tilde{C}}$ and $\left([r \tilde{\mathrm{C}}]_{j},[l \tilde{\mathrm{C}}]_{j}\right)=(\{j, j+1\},\{j, \overline{j+1}\})$, then $\left(\left[r \tilde{\mathrm{C}}^{\prime}\right]_{j},\left[l \tilde{\mathrm{C}}^{\prime}\right]_{j}\right)=$ $(\{j, j+1\},\{j+1, \bar{j}\})$, by (188). It follows from $f_{j} \tilde{\mathrm{C}}=(\tilde{\mathrm{C}} \backslash\{j\}) \sqcup\{j+1\}$ that $\mathrm{C}^{\prime}=(\mathrm{C} \backslash\{j\}) \sqcup\{j+1\}, I_{\mathrm{C}^{\prime}}=I_{\mathrm{C}}, J_{\mathrm{C}^{\prime}}=J_{\mathrm{C}}$, and $K_{f_{j} \tilde{\mathrm{C}}}=\left(K_{\tilde{\mathrm{C}}} \backslash\{j+1\}\right) \sqcup\{j\}$. By (195), $\Phi_{i}\left(f_{j} \tilde{\mathrm{C}}\right)=\left(r \tilde{\mathrm{C}}^{\prime}, l \tilde{\mathrm{C}}^{\prime}\right)$.

If $j+1 \in J_{\mathrm{C}}$ and $\left([r \tilde{\mathrm{C}}]_{j},[l \tilde{\mathrm{C}}]_{j}\right)=(\{j, \overline{j+1}\},\{j, j+1\})$, then $\left(\left[r \tilde{\mathrm{C}}^{\prime}\right]_{j},\left[l \tilde{\mathrm{C}}^{\prime}\right]_{j}\right)=$ $(\{j+1, \bar{j}\},\{j, j+1\})$ by (188). It follows from $f_{j} \tilde{\mathrm{C}}=(\tilde{\mathrm{C}} \backslash\{j\}) \sqcup\{j+1\}$ that $\mathrm{C}^{\prime}=(\mathrm{C} \backslash\{j\}) \sqcup\{j+1\}, I_{\mathrm{C}^{\prime}}=I_{\mathrm{C}}, J_{\mathrm{C}^{\prime}}=\left(J_{\mathrm{C}} \backslash\{j+1\}\right) \sqcup\{j\}$, and $K_{f_{j} \tilde{\mathrm{c}}}=K_{\tilde{\mathrm{C}}}$. By (195), $\Phi_{i}\left(f_{j} \tilde{\mathrm{C}}\right)=\left(r \tilde{\mathrm{C}}^{\prime}, l \tilde{\mathrm{C}}^{\prime}\right)$.

Case 3. Assume that $[\tilde{\mathrm{C}}]_{j}=\{j+1\}$. By (133)-(136), $f_{j} \tilde{\mathrm{C}}=\mathbf{0}$. It follows from $[\tilde{\mathrm{C}}]_{j}=$ $\{j+1\}$ and (194) that $j+1 \in\|\mathrm{C}\| \backslash I_{\mathrm{C}}$, and that $\left(j \in K_{\tilde{\mathrm{C}}}\right)$ or $\left(j \in J_{\mathrm{C}}\right)$, hence that $\left([r \tilde{C}]_{j},[l \tilde{\mathrm{C}}]_{j}\right)$ is either $(\{j, j+1\},\{j+1, \bar{j}\})$ or $(\{j+1, \bar{j}\},\{j, j+1\})$. By (189), $f_{j}(r \tilde{\mathrm{C}}, l \tilde{\mathrm{C}})=\mathbf{0}$.

Case 4. Assume that $[\tilde{\mathrm{C}}]_{j}=\{\overline{j+1}\}$. By (134), $f_{j} \tilde{\mathrm{C}}=(\tilde{\mathrm{C}} \backslash\{\overline{j+1}\}) \sqcup\{\bar{j}\}$. It follows from $[\tilde{\mathrm{C}}]_{j}=\{\overline{j+1}\}$ and (194) that $j+1 \in\|\mathrm{C}\| \backslash I_{\mathrm{C}}$, and that $\left(j \in K_{\tilde{\mathrm{C}}}\right)$ or $\left(j \in J_{\mathrm{C}}\right)$, hence that $\left([r \tilde{C}]_{j},[l \tilde{\mathrm{C}}]_{j}\right)$ is either $(\{j, \overline{j+1}\},\{\bar{j}, \overline{j+1}\})$ or $(\{\bar{j}, \overline{j+1}\},\{j, \overline{j+1}\})$.

If $j \in K_{\tilde{C}}$ and $\left([r \tilde{\mathrm{C}}]_{j},[l \tilde{\mathrm{C}}]_{j}\right)=(\{j, \overline{j+1}\},\{\bar{j}, \overline{j+1}\})$, then $\left(\left[r \tilde{\mathrm{C}}^{\prime}\right]_{j},\left[l \tilde{\mathrm{C}}^{\prime}\right]_{j}\right)=(\{j+$ $1, \bar{j}\},\{\bar{j}, \overline{j+1}\}$ ), by (188). It follows from $f_{j} \tilde{\mathrm{C}}=(\tilde{\mathrm{C}} \backslash\{\overline{j+1}\}) \sqcup\{\bar{j}\}$ that $\mathrm{C}^{\prime}=(\mathrm{C} \backslash$ $\{\overline{j+1}\}) \sqcup\{\bar{j}\}, I_{\mathrm{C}^{\prime}}=I_{\mathrm{C}}, J_{\mathrm{C}^{\prime}}=J_{\mathrm{C}}$, and $K_{f_{j} \tilde{\mathrm{C}}}=\left(K_{\tilde{\mathrm{C}}} \backslash\{j\}\right) \sqcup\{j+1\}$. By (195), $\Phi_{i}\left(f_{j} \tilde{\mathrm{C}}\right)=\left(r \tilde{\mathrm{C}}^{\prime}, l \tilde{\mathrm{C}}^{\prime}\right)$.

If $j \in J_{\mathrm{C}}$ and $\left([r \tilde{\mathrm{C}}]_{j},[l \tilde{\mathrm{C}}]_{j}\right)=(\{\bar{j}, \overline{j+1}\},\{j, \overline{j+1}\})$, then $\left(\left[r \tilde{\mathrm{C}}^{\prime}\right]_{j},\left[l \tilde{\mathrm{C}}^{\prime}\right]_{j}\right)=$ $(\{\bar{j}, \overline{j+1}\},\{j+1, \bar{j}\})$, by (188). It follows from $f_{j} \tilde{\mathrm{C}}=(\tilde{\mathrm{C}} \backslash\{\overline{j+1}\}) \sqcup\{\bar{j}\}$ that $\mathrm{C}^{\prime}=(\mathrm{C} \backslash\{\overline{j+1}\}) \sqcup\{\bar{j}\}, I_{\mathrm{C}^{\prime}}=I_{\mathrm{C}}, J_{\mathrm{C}^{\prime}}=\left(J_{\mathrm{C}} \backslash\{j\}\right) \sqcup\{j+1\}$, and $K_{f_{j} \tilde{\mathrm{c}}}=K_{\tilde{\mathrm{C}}}$. By (195), $\Phi_{i}\left(f_{j} \tilde{\mathrm{C}}\right)=\left(r \tilde{\mathrm{C}}^{\prime}, l \tilde{\mathrm{C}}^{\prime}\right)$.

Case 5. Assume that $[\tilde{\mathrm{C}}]_{j}=\{\bar{j}\}$. By (133)-(136), $f_{j} \tilde{\mathrm{C}}=\mathbf{0}$. It follows from $[\tilde{\mathrm{C}}]_{j}=\{\bar{j}\}$ and (194) that $j \in\|\mathrm{C}\| \backslash I_{\mathrm{C}}$, and that $(j=i),\left(j+1 \in K_{\tilde{\mathrm{C}}}\right)$, or $\left(j+1 \in J_{\mathrm{C}}\right)$, hence that $\left([r \tilde{\mathrm{C}}]_{j},[l \tilde{\mathrm{C}}]_{j}\right)$ is either $(\{\bar{j}\},\{\bar{j}\}),(\{j+1, \bar{j}\},\{\overline{j+1}, \bar{j}\})$, or $(\{\overline{j+1}, \bar{j}\},\{j+1, \bar{j}\})$. By $(189), f_{j}(r \tilde{\mathrm{C}}, l \tilde{\mathrm{C}})=\mathbf{0}$.
Case 6. Assume that $[\tilde{\mathrm{C}}]_{j}=\{j, j+1\}$. By (133)-(136), $f_{j} \tilde{\mathrm{C}}=\mathbf{0}$. It follows from $[\tilde{\mathrm{C}}]_{j}=$ $\{j, j+1\}$ and (194) that $j, j+1 \in\|\mathrm{C}\| \backslash I_{\mathrm{C}}$ and $\left([r \tilde{\mathrm{C}}]_{j},[l \tilde{\mathrm{C}}]_{j}\right)=(\{j, j+1\},\{j, j+1\})$. By (189), $f_{j}(r \tilde{\mathrm{C}}, l \tilde{\mathrm{C}})=\mathbf{0}$.
Case 7. Assume that $[\tilde{\mathrm{C}}]_{j}=\{j, \overline{j+1}\}$. By (135), $f_{j} \tilde{\mathrm{C}}=(\tilde{\mathrm{C}} \backslash\{j\}) \sqcup\{j+1\}$. It follows from $[\tilde{\mathrm{C}}]_{j}=\{j, \overline{j+1}\}$ and (194) that $j, j+1 \in\|\mathrm{C}\| \backslash I_{\mathrm{C}}$ and $\left([r \tilde{\mathrm{C}}]_{j},[l \tilde{\mathrm{C}}]_{j}\right)=$ $(\{j, \overline{j+1}\},\{j, \overline{j+1}\})$. By (188), $\left.\left(\left[r \tilde{\mathrm{C}}^{\prime}\right]_{j},\left[l \tilde{\mathrm{C}}^{\prime}\right)\right]_{j}\right)=(\{j+1, \bar{j}\},\{j, \overline{j+1}\})$. It follows from $f_{j} \tilde{\mathrm{C}}=(\tilde{\mathrm{C}} \backslash\{j\}) \sqcup\{j+1\}$ that $\mathrm{C}^{\prime}=(\mathrm{C} \backslash\{j\}) \sqcup\{j+1\}, I_{\mathrm{C}^{\prime}}=I_{\mathrm{C}} \sqcup\{j+1\}$, $J_{\mathrm{C}^{\prime}}=J_{\mathrm{C}} \sqcup\{j\}$, and $K_{f_{j} \tilde{\mathrm{C}}}=K_{\tilde{\mathrm{C}}}$. $\mathrm{By}(195), \Phi_{i}\left(f_{j} \tilde{\mathrm{C}}\right)=\left(r \tilde{\mathrm{C}}^{\prime}, l \tilde{\mathrm{C}}^{\prime}\right)$.

Case 8. Assume that $[\tilde{\mathrm{C}}]_{j}=\{j, \bar{j}\}$. By (133)-(136), $f_{j} \tilde{\mathrm{C}}=\mathbf{0}$. It follows from $[\tilde{\mathrm{C}}]_{j}=$ $\{j, \bar{j}\}$ and (194) that $j \in I_{\mathrm{C}}$, and that $(j=i),\left(j+1 \in K_{\tilde{\mathrm{C}}}\right)$, or $\left(j+1 \in J_{\mathrm{C}}\right)$, hence that $\left([r \tilde{C}]_{j},[l \tilde{C}]_{j}\right)$ is either $(\{j\},\{\bar{j}\}),(\{j, j+1\},\{\overline{j+1}, \bar{j}\})$, or $(\{j, \overline{j+1}\},\{j+1, \bar{j}\})$. By (189), $f_{j}(r \tilde{\mathrm{C}}, l \tilde{\mathrm{C}})=\mathbf{0}$.

Case 9. Assume that $[\tilde{\mathrm{C}}]_{j}=\{j+1, \overline{j+1}\}$. By (135), $f_{j} \tilde{\mathrm{C}}=(\tilde{\mathrm{C}} \backslash\{\overline{j+1}\}) \sqcup\{\bar{j}\}$. It follows from $[\tilde{\mathrm{C}}]_{j}=\{j+1, \overline{j+1}\}$ and (194) that $j+1 \in I_{\mathrm{C}}, j \in J_{\mathrm{C}}$, and $\left([r \tilde{\mathrm{C}}]_{j},[l \tilde{\mathrm{C}}]_{j}\right)=$ $(\{j+1, \bar{j}\},\{j, \overline{j+1}\})$. By (188), $\left.\left(\left[r \tilde{C}^{\prime}\right]_{j},\left[l \tilde{C}^{\prime}\right)\right]_{j}\right)=(\{j+1, \bar{j}\},\{j+1, \bar{j}\})$. It follows from $f_{j} \tilde{\mathrm{C}}=(\tilde{\mathrm{C}} \backslash\{\overline{j+1}\}) \sqcup\{\bar{j}\}$ that $\mathrm{C}^{\prime}=(\mathrm{C} \backslash\{\overline{j+1}\}) \sqcup\{\bar{j}\}, I_{\mathrm{C}^{\prime}}=I_{\mathrm{C}} \backslash\{j+1\}$, $J_{\mathrm{C}^{\prime}}=J_{\mathrm{C}} \backslash\{j\}$, and $K_{f_{j} \tilde{\mathrm{C}}}=K_{\tilde{\mathrm{C}}}$. By (195), $\Phi_{i}\left(f_{j} \tilde{\mathrm{C}}\right)=\left(r \tilde{\mathrm{C}}^{\prime}, l \tilde{\mathrm{C}}^{\prime}\right)$.

Case 10. Assume that $[\tilde{\mathrm{C}}]_{j}=\{j+1, \bar{j}\}$. By (133)-(136), $f_{j} \tilde{\mathrm{C}}=\mathbf{0}$. It follows from $[\tilde{\mathrm{C}}]_{j}=\{j+1, \bar{j}\}$ and (194) that $j, j+1 \in\|\mathrm{C}\| \backslash I_{\mathrm{C}}$ and $\left([r \tilde{\mathrm{C}}]_{j},[l \tilde{\mathrm{C}}]_{j}\right)=(\{j+1, \bar{j}\},\{j+$ $1, \bar{j}\})$. By (189), $f_{j}(r \tilde{\mathrm{C}}, l \tilde{\mathrm{C}})=\mathbf{0}$.

Case 11. Assume that $[\tilde{\mathrm{C}}]_{j}=\{\overline{j+1}, \bar{j}\}$. By (133)-(136), $f_{j} \tilde{\mathrm{C}}=\mathbf{0}$. It follows from $[\tilde{\mathrm{C}}]_{j}=\{\overline{j+1}, \bar{j}\}$ and (194) that $j, j+1 \in\|\mathrm{C}\| \backslash I_{\mathrm{C}}$ and $\left([r \tilde{\mathrm{C}}]_{j},[l \tilde{\mathrm{C}}]_{j}\right)=$ $(\{\overline{j+1}, \bar{j}\},\{\overline{j+1}, \bar{j}\})$. Вy (189), $f_{j}(r \tilde{\mathrm{C}}, l \tilde{\mathrm{C}})=\mathbf{0}$.

Case 12. Assume that $[\tilde{\mathrm{C}}]_{j}=\{j, j+1, \overline{j+1}\}$. By (136), $f_{j} \tilde{\mathrm{C}}=(\tilde{\mathrm{C}} \backslash\{\overline{j+1}\}) \sqcup\{\bar{j}\}$. It follows from $[\tilde{\mathrm{C}}]_{j}=\{j, j+1, \overline{j+1}\}$ and (194) that $j+1 \in I_{\mathrm{C}}, j \in\|\mathrm{C}\| \backslash I_{\mathrm{C}}$, and $\left([r \tilde{\mathrm{C}}]_{j},[l \tilde{\mathrm{C}}]_{j}\right)=(\{j, j+1\},\{j, \overline{j+1}\})$. By (188), $\left.\left(\left[r \tilde{\mathrm{C}}^{\prime}\right]_{j},\left[l \tilde{\mathrm{C}}^{\prime}\right)\right]_{j}\right)=(\{j, j+1\},\{j+1, \bar{j}\})$. It follows from $f_{j} \tilde{\mathrm{C}}=(\tilde{\mathrm{C}} \backslash\{\overline{j+1}\}) \sqcup\{\bar{j}\}$ that $\mathrm{C}^{\prime}=(\mathrm{C} \backslash\{\overline{j+1}\}) \sqcup\{\bar{j}\}, I_{\mathrm{C}^{\prime}}=$ $\left(I_{\mathrm{C}} \backslash\{j+1\}\right) \sqcup\{j\}, J_{\mathrm{C}^{\prime}}=J_{\mathrm{C}}$, and $K_{f_{j} \tilde{\mathrm{C}}}=K_{\tilde{\mathrm{C}}}$. $\mathrm{By}(195), \Phi_{i}\left(f_{j} \tilde{\mathrm{C}}\right)=\left(r \tilde{\mathrm{C}}^{\prime}, l \tilde{\mathrm{C}}^{\prime}\right)$.

Case 13. Assume that $[\tilde{\mathrm{C}}]_{j}=\{j, j+1, \bar{j}\}$. By (133)-(136), $f_{j} \tilde{\mathrm{C}}=\mathbf{0}$. It follows from $[\tilde{\mathrm{C}}]_{j}=\{j, j+1, \bar{j}\}$ and (194) that $j \in I_{\mathrm{C}}, j+1 \in\|\mathrm{C}\| \backslash I_{\mathrm{C}}$, and $\left([r \tilde{\mathrm{C}}]_{j},[l \tilde{\mathrm{C}}]_{j}\right)=$ $(\{j, j+1\},\{j+1, \bar{j}\})$. Ву $(189), f_{j}(r \tilde{\mathrm{C}}, l \tilde{\mathrm{C}})=\mathbf{0}$.

Case 14. Assume that $[\tilde{\mathrm{C}}]_{j}=\{j, \overline{j+1}, \bar{j}\}$. By (136), $f_{j} \tilde{\mathrm{C}}=(\tilde{\mathrm{C}} \backslash\{j\}) \sqcup\{j+1\}$. It follows from $[\tilde{\mathrm{C}}]_{j}=\{j, \overline{j+1}, \bar{j}\}$ and (194) that $j \in I_{\mathrm{C}}, j+1 \in\|\mathrm{C}\| \backslash I_{\mathrm{C}}$, and $\left([r \tilde{\mathrm{C}}]_{j},[l \tilde{\mathrm{C}}]_{j}\right)=$ $(\{j, \overline{j+1}\},\{\bar{j}, \overline{j+1}\})$. By (188), $\left.\left(\left[r \tilde{\mathrm{C}}^{\prime}\right]_{j},\left[l \tilde{\mathrm{C}}^{\prime}\right)\right]_{j}\right)=(\{j+1, \bar{j}\},\{\bar{j}, \overline{j+1}\})$. It follows from $f_{j} \tilde{\mathrm{C}}=(\tilde{\mathrm{C}} \backslash\{j\}) \sqcup\{j+1\}$ that $\mathrm{C}^{\prime}=(\mathrm{C} \backslash\{j\}) \sqcup\{j+1\}, I_{\mathrm{C}^{\prime}}=\left(I_{\mathrm{C}} \backslash\{j\}\right) \sqcup\{j+1\}$, $J_{\mathrm{C}^{\prime}}=J_{\mathrm{C}}$, and $K_{f_{j} \tilde{\mathrm{C}}}=K_{\tilde{\mathrm{C}}}$. By (195), $\Phi_{i}\left(f_{j} \tilde{\mathrm{C}}\right)=\left(r \tilde{\mathrm{C}}^{\prime}, l \tilde{\mathrm{C}}^{\prime}\right)$.

Case 15. Assume that $[\tilde{\mathrm{C}}]_{j}=\{j+1, \overline{j+1}, \bar{j}\}$. By (133)-(136), $f_{j} \tilde{\mathrm{C}}=\mathbf{0}$. It follows from $[\tilde{\mathrm{C}}]_{j}=\{j+1, \overline{j+1}, \bar{j}\}$ and (194) that $j+1 \in I_{\mathrm{C}}, j \in\|\mathrm{C}\| \backslash I_{\mathrm{C}}$, and $\left([r \tilde{\mathrm{C}}]_{j},[l \tilde{\mathrm{C}}]_{j}\right)=$ $(\{j+1, \bar{j}\},\{\overline{j+1}, \bar{j}\})$. Вy $(189), f_{j}(r \tilde{\mathrm{C}}, l \tilde{\mathrm{C}})=\mathbf{0}$.

Case 16. Assume that $[\tilde{\mathrm{C}}]_{j}=\{j, j+1, \overline{j+1}, \bar{j}\}$. By (133)-(136), $f_{j} \tilde{\mathrm{C}}=\mathbf{0}$. It follows from $[\tilde{\mathrm{C}}]_{j}=\{j, j+1, \overline{j+1}, \bar{j}\}$ and (194) that $j, j+1 \in I_{\mathrm{C}}$ and $\left([r \tilde{\mathrm{C}}]_{j},[l \tilde{\mathrm{C}}]_{j}\right)=(\{j, j+$ $1\},\{\overline{j+1}, \bar{j}\})$. By (189), $f_{j}(r \tilde{C}, l \tilde{\mathrm{C}})=\mathbf{0}$.

We next assume that $j=0$. Similarly to (194), we have

$$
\begin{equation*}
\{1,2\} \cap J_{1} \subset I_{\mathrm{C}} \sqcup J_{\mathrm{C}} \sqcup K_{\tilde{\mathrm{C}}} \sqcup(\underbrace{\{\|\mathrm{C}(u)\| \mid u \in[i-2 m]\} \backslash I_{\mathrm{C}}}_{=\|\mathrm{C}\| \backslash I_{\mathrm{C}}}) . \tag{196}
\end{equation*}
$$

Recall that $[\tilde{\mathrm{C}}]_{0}=\tilde{\mathrm{C}} \cap\{1,2, \overline{2}, \overline{1}\},[l \tilde{\mathrm{C}}]_{0}=l \tilde{\mathrm{C}} \cap\{1,2, \overline{2}, \overline{1}\}$, and $[r \tilde{\mathrm{C}}]_{0}=r \tilde{\mathrm{C}} \cap\{1,2, \overline{2}, \overline{1}\}$. If $p_{1}>2$, then $f_{0} \tilde{\mathrm{C}}=\mathbf{0}$ by (150)-(152), and $f_{0}(r \tilde{\mathrm{C}}, l \tilde{\mathrm{C}})=\mathbf{0}$ by $[l \tilde{\mathrm{C}}]_{0}=[r \tilde{\mathrm{C}}]_{0}=\varnothing$ and (192). Therefore we can assume that $J_{1}=[i]$ or $J_{1}=[2, i+1]$; note that if $p_{1}=2$, then $m=0$. If $f_{0} \tilde{\mathrm{C}} \neq \mathbf{0}$, then we continue to use the notation $f_{0} \tilde{\mathrm{C}}=\mathrm{C}^{\prime} \cup\{\overline{0}, \ldots, \overline{0}\}$ and (195) for $j=0$. If $f_{0}(r \tilde{\mathrm{C}}, l \tilde{\mathrm{C}}) \neq \mathbf{0}$, then we write $\left(r \tilde{\mathrm{C}}^{\prime}, l \tilde{\mathrm{C}}^{\prime}\right)=f_{0}(r \tilde{\mathrm{C}}, l \tilde{\mathrm{C}}),\left[l \tilde{\mathrm{C}}^{\prime}\right]_{0}=$
$l \tilde{\mathrm{C}}^{\prime} \cap\{1,2, \overline{2}, \overline{1}\}$, and $\left[r \tilde{\mathrm{C}}^{\prime}\right]_{0}=r \tilde{\mathrm{C}}^{\prime} \cap\{1,2, \overline{2}, \overline{1}\}$. Recall that $z_{k}=\min I_{\mathrm{C}}$ and $y_{k}=\min J_{\mathrm{C}}$.
If $m>0$, then $x_{1}=\min K_{\tilde{\mathrm{C}}}$ and $x_{2}=\min \left(K_{\tilde{\mathrm{C}}} \backslash\left\{x_{1}\right\}\right)$.
We see from (QKN-B2) and (KN-B3) that $\{1,2\} \cap I_{\mathrm{C}} \neq \varnothing$ implies $[\tilde{\mathrm{C}}]_{0}=\{2, \overline{2}\}$. Hence we have the following ten cases.

Case 1. Assume that $[\tilde{\mathrm{C}}]_{0}=\varnothing$. It follows from (196) that $\left(1,2 \in K_{\tilde{C}}\right),\left(1 \in K_{\tilde{\mathrm{C}}}\right.$ and $\left.2=y_{k} \in J_{\mathrm{C}}\right)$, or $\left(2=p_{1}=y_{k} \in J_{\mathrm{C}}\right)$, hence that $\left([r \tilde{\mathrm{C}}]_{0},[l \tilde{\mathrm{C}}]_{0}\right)$ is either $(\{1,2\},\{\overline{2}, \overline{1}\})$, $(\{1, \overline{2}\},\{2, \overline{1}\})$, or $(\{\overline{2}\},\{2\})$.

If $1,2 \in K_{\tilde{\mathrm{C}}}$ and $\left([r \tilde{\mathrm{C}}]_{0},[l \tilde{\mathrm{C}}]_{0}\right)=(\{1,2\},\{\overline{2}, \overline{1}\})$, then $m>0$ and $y_{k} \notin\{1,2\}$. By $(151), f_{0} \tilde{\mathrm{C}} \underset{\tilde{\mathrm{C}}}{=}(\tilde{\mathrm{C}} \backslash\{\overline{0}, \overline{0}\}) \sqcup\{1,2\}$. By (191), $\left(\left[r \tilde{\mathrm{C}}^{\prime}\right]_{0},\left[l \tilde{\mathrm{C}}^{\prime}\right]_{0}\right)=(\{1,2\},\{1,2\})$. It follows from $f_{0} \tilde{\mathrm{C}}=(\tilde{\mathrm{C}} \backslash\{\overline{0}, \overline{0}\}) \sqcup\{1,2\}$ that $\mathrm{C}^{\prime}=\mathrm{C} \sqcup\{1,2\}, I_{\mathrm{C}^{\prime}}=I_{\mathrm{C}}, J_{\mathrm{C}^{\prime}}=J_{\mathrm{C}}$, and $K_{f_{0} \tilde{\mathrm{C}}}=K_{\tilde{\mathrm{C}}} \backslash\{1,2\}$. By (195), $\Phi_{i}\left(f_{0} \tilde{\mathrm{C}}\right)=\left(r \tilde{\mathrm{C}}^{\prime}, l \tilde{\mathrm{C}}^{\prime}\right)$.

Assume that $2=y_{k} \in J_{\mathrm{C}}$, and that $\left([r \tilde{\mathrm{C}}]_{0},[l \tilde{\mathrm{C}}]_{0}\right)$ is either $(\{1, \overline{2}\},\{2, \overline{1}\})$ or $(\{\overline{2}\},\{2\})$. By $(150)-(152), f_{0} \tilde{\mathrm{C}}=\mathbf{0}$. By $(192), f_{0}(r \tilde{\mathrm{C}}, l \tilde{\mathrm{C}})=\mathbf{0}$.

Case 2. Assume that $[\tilde{\mathrm{C}}]_{0}=\{1\}$. By (150)-(152), $f_{0} \tilde{\mathrm{C}}=\mathbf{0}$. It follows from $[\tilde{\mathrm{C}}]_{0}=\{1\}$ and (196) that $1 \in\|\mathrm{C}\| \backslash I_{\mathrm{C}}$, and that $(i=1),\left(2 \in K_{\tilde{\mathrm{C}}}\right)$, or $\left(2 \in J_{\mathrm{C}}\right)$, hence that $\left([r \tilde{C}]_{0},[l \tilde{\mathrm{C}}]_{0}\right)$ is either $(\{1\},\{1\}),(\{1,2\},\{1, \overline{2}\})$, or $(\{1, \overline{2}\},\{1,2\})$. By (192), $f_{0}(r \tilde{\mathrm{C}}, l \tilde{\mathrm{C}})=\mathbf{0}$.

Case 3. Assume that $[\tilde{\mathrm{C}}]_{0}=\{2\}$. By (150)-(152), $f_{0} \tilde{\mathrm{C}}=\mathbf{0}$. It follows from $[\tilde{\mathrm{C}}]_{0}=\{2\}$ and (196) that $2 \in\|\mathrm{C}\| \backslash I_{\mathrm{C}}$, and that $\left(p_{1}=2\right)$, $\left(1 \in K_{\tilde{\mathrm{C}}}\right)$, or $\left(1 \in J_{\mathrm{C}}\right)$, hence that $\left([r \tilde{\mathrm{C}}]_{0},[l \tilde{\mathrm{C}}]_{0}\right)$ is either $(\{2\},\{2\}),(\{1,2\},\{2, \overline{1}\})$, or $(\{2, \overline{1}\},\{1,2\})$. By (192), $f_{0}(r \tilde{\mathrm{C}}, l \tilde{\mathrm{C}})=\mathbf{0}$.

Case 4. Assume that $[\tilde{\mathrm{C}}]_{0}=\{\overline{2}\}$. It follows from (196) that $2 \in\|\mathrm{C}\| \backslash I_{\mathrm{C}}$, and that $\left(p_{1}=2\right),\left(1=x_{1} \in K_{\tilde{\mathrm{C}}}\right)$, or $\left(1=y_{k} \in J_{\mathrm{C}}\right)$, hence that $\left([r \tilde{\mathrm{C}}]_{0},[l \tilde{\mathrm{C}}]_{0}\right)$ is either $(\{\overline{2}\},\{\overline{2}\})$, $(\{1, \overline{2}\},\{\overline{2}, \overline{1}\})$, or $(\{\overline{2}, \overline{1}\},\{1, \overline{2}\})$.

If $p_{1}=2$ and $\left([r \tilde{\mathrm{C}}]_{0},[l \tilde{\mathrm{C}}]_{0}\right)=(\{\overline{2}\},\{\overline{2}\})$, then $m=0$ and $y_{k} \notin\{1,2\}$. By (150), $f_{0} \tilde{\mathrm{C}}=(\tilde{\mathrm{C}} \backslash\{\overline{2}\}) \sqcup\{1\}$. By (191), $\left(\left[r \tilde{\mathrm{C}}^{\prime}\right]_{0},\left[l \tilde{\mathrm{C}}^{\prime}\right]_{0}\right)=(\{1\},\{1\})$. It follows from $f_{0} \tilde{\mathrm{C}}=$ $(\tilde{\mathrm{C}} \backslash\{\overline{2}\}) \sqcup\{1\}$ that $\mathrm{C}^{\prime}=(\mathrm{C} \backslash\{\overline{2}\}) \sqcup\{1\}, I_{\mathrm{C}^{\prime}}=I_{\mathrm{C}}, J_{\mathrm{C}^{\prime}}=J_{\mathrm{C}}$, and $K_{f_{0} \tilde{\mathrm{C}}}=K_{\tilde{\mathrm{C}}}=\varnothing$; note that $\mathcal{J}\left(r f_{0} \tilde{\mathrm{C}}\right)=\mathcal{J}\left(l f_{0} \tilde{\mathrm{C}}\right)=(\{1\}<[3, i+1])$. By $(195), \Phi_{i}\left(f_{0} \tilde{\mathrm{C}}\right)=\left(r \tilde{\mathrm{C}}^{\prime}, l \tilde{\mathrm{C}}^{\prime}\right)$.

If $1=x_{1} \in K_{\tilde{\mathrm{C}}}$ and $\left([r \tilde{\mathrm{C}}]_{0},[l \tilde{\mathrm{C}}]_{0}\right)=(\{1, \overline{2}\},\{\overline{2}, \overline{1}\})$, then $m>0$ and $y_{k} \notin\{1,2\}$. By (151), $f_{0} \tilde{\mathrm{C}}=(\tilde{\mathrm{C}} \backslash\{\overline{2}, \overline{0}, \overline{0}\}) \sqcup\left\{1, x_{2}, \overline{x_{2}}\right\}$. By (191), $\left(\left[r \tilde{\mathrm{C}}^{\prime}\right]_{0},\left[l \tilde{\mathrm{C}}^{\prime}\right]_{0}\right)=(\{1, \overline{2}\},\{1,2\})$. It follows from $f_{0} \tilde{\mathrm{C}}=(\tilde{\mathrm{C}} \backslash\{\overline{2}, \overline{0}, \overline{0}\}) \sqcup\left\{1, x_{2}, \overline{x_{2}}\right\}$ that $\mathrm{C}^{\prime}=(\mathrm{C} \backslash\{\overline{2}\}) \sqcup\left\{1, x_{2}, \overline{x_{2}}\right\}, I_{\mathrm{C}^{\prime}}=$ $I_{\mathrm{C}} \sqcup\left\{x_{2}\right\}, J_{\mathrm{C}^{\prime}}=J_{\mathrm{C}} \sqcup\{2\}$, and $K_{f_{0} \tilde{\mathrm{C}}}=K_{\tilde{\mathrm{C}}} \backslash\left\{1, x_{2}\right\}$. By $(195), \Phi_{i}\left(f_{0} \tilde{\mathrm{C}}\right)=\left(r \tilde{\mathrm{C}}^{\prime}, l \tilde{\mathrm{C}}^{\prime}\right)$.

Assume that $1=y_{k} \in J_{\mathrm{C}}$ and $\left([r \tilde{\mathrm{C}}]_{0},[l \tilde{\mathrm{C}}]_{0}\right)=(\{\overline{2}, \overline{1}\},\{1, \overline{2}\})$. By (152), $f_{0} \tilde{\mathrm{C}}=$ $\left(\tilde{\mathrm{C}} \backslash\left\{z_{k}, \overline{z_{k}}, \overline{2}\right\}\right) \sqcup\{1, \overline{0}, \overline{0}\}$. By (191), $\left(\left[r \tilde{\mathrm{C}}^{\prime}\right]_{0},\left[l \tilde{C}^{\prime}\right]_{0}\right)=(\{1,2\},\{1, \overline{2}\})$. It follows from $f_{0} \tilde{\mathrm{C}}=\left(\tilde{\mathrm{C}} \backslash\left\{z_{k}, \overline{z_{k}}, \overline{2}\right\}\right) \sqcup\{1, \overline{0}, \overline{0}\}$ that $\mathrm{C}^{\prime}=\left(\mathrm{C} \backslash\left\{z_{k}, \overline{z_{k}}, \overline{2}\right\}\right) \sqcup\{1\}, I_{\mathrm{C}^{\prime}}=I_{\mathrm{C}} \backslash\left\{z_{k}\right\}$, $J_{\mathrm{C}^{\prime}}=J_{\mathrm{C}} \backslash\{1\}$, and $K_{f_{0} \tilde{\mathrm{C}}}=K_{\tilde{\mathrm{C}}} \sqcup\left\{2, z_{k}\right\}$. By (195), $\Phi_{i}\left(f_{0} \tilde{\mathrm{C}}\right)=\left(r \tilde{\mathrm{C}}^{\prime}, l \tilde{\mathrm{C}}^{\prime}\right)$.

Case 5. Assume that $[\tilde{\mathrm{C}}]_{0}=\{\overline{1}\}$. It follows from (196) that $1 \in\|\mathrm{C}\| \backslash I_{\mathrm{C}}$, and that $(i=1),\left(2=x_{1} \in K_{\tilde{\mathrm{C}}}\right)$, or $\left(2=y_{k} \in J_{\mathrm{C}}\right)$, hence that $\left([r \tilde{\mathrm{C}}]_{0},[l \tilde{\mathrm{C}}]_{0}\right)$ is either $(\{\overline{1}\},\{\overline{1}\})$, $(\{2, \overline{1}\},\{\overline{2}, \overline{1}\})$, or $(\{\overline{2}, \overline{1}\},\{2, \overline{1}\})$.

If $i=1$ and $\left([r \tilde{\mathrm{C}}]_{0},[l \tilde{\mathrm{C}}]_{0}\right)=(\{\overline{1}\},\{\overline{1}\})$, then $m=0$ and $y_{k} \notin\{1,2\}$. By (150), $f_{0} \tilde{\mathrm{C}}=(\tilde{\mathrm{C}} \backslash\{\overline{1}\}) \sqcup\{2\}=\{2\}$. By $(191),\left(\left[r \tilde{\mathrm{C}}^{\prime}\right]_{0},\left[l \tilde{\mathrm{C}}^{\prime}\right]_{0}\right)=\left(r \tilde{\mathrm{C}}^{\prime}, l \tilde{\mathrm{C}}^{\prime}\right)=(\{2\},\{2\})$. It follows from $f_{0} \tilde{\mathrm{C}}=\{2\}$ that $\mathrm{C}^{\prime}=\{2\}$ and $I_{\mathrm{C}^{\prime}}=J_{\mathrm{C}^{\prime}}=K_{f_{0} \tilde{\mathrm{C}}}=\varnothing$; note that $\mathcal{J}\left(r f_{0} \tilde{\mathrm{C}}\right)=\mathcal{J}\left(l f_{0} \tilde{\mathrm{C}}\right)=(\{2\}) . \mathrm{By}(195), \Phi_{i}\left(f_{0} \tilde{\mathrm{C}}\right)=\left(r \tilde{\mathrm{C}}^{\prime}, l \tilde{\mathrm{C}}^{\prime}\right)$.

If $2=x_{1} \in K_{\tilde{\mathrm{C}}}$ and $\left([r \tilde{\mathrm{C}}]_{0},[l \tilde{\mathrm{C}}]_{0}\right)=(\{2, \overline{1}\},\{\overline{2}, \overline{1}\})$, then $m>0$ and $y_{k} \notin\{1,2\}$. By (151), $f_{0} \tilde{\mathrm{C}}=(\tilde{\mathrm{C}} \backslash\{\overline{1}, \overline{0}, \overline{0}\}) \sqcup\left\{2, x_{2}, \overline{x_{2}}\right\}$. By (191), $\left(\left[r \tilde{\mathrm{C}}^{\prime}\right]_{0},\left[l \tilde{\mathrm{C}}^{\prime}\right]_{0}\right)=(\{2, \overline{1}\},\{1,2\})$. It
follows from $f_{0} \tilde{\mathrm{C}}=(\tilde{\mathrm{C}} \backslash\{\overline{1}, \overline{0}, \overline{0}\}) \sqcup\left\{2, x_{2}, \overline{x_{2}}\right\}$ that $\mathrm{C}^{\prime}=(\mathrm{C} \backslash\{\overline{1}\}) \sqcup\left\{2, x_{2}, \overline{x_{2}}\right\}, I_{\mathrm{C}^{\prime}}=$ $I_{\mathrm{C}} \sqcup\left\{x_{2}\right\}, J_{\mathrm{C}^{\prime}}=J_{\mathrm{C}} \sqcup\{1\}$, and $K_{f_{0} \tilde{\mathrm{C}}}=K_{\tilde{\mathrm{C}}} \backslash\left\{2, x_{2}\right\}$. By (195), $\Phi_{i}\left(f_{0} \tilde{\mathrm{C}}\right)=\left(r \tilde{\mathrm{C}}^{\prime}, l \tilde{\mathrm{C}}^{\prime}\right)$.

Assume that $2=y_{k} \in J_{\mathrm{C}}$ and $\left([r \tilde{\mathrm{C}}]_{0},[l \tilde{\mathrm{C}}]_{0}\right)=(\{\overline{2}, \overline{1}\},\{2, \overline{1}\})$. By (152), $f_{0} \tilde{\mathrm{C}}=$ $\left(\tilde{\mathrm{C}} \backslash\left\{z_{k}, \overline{z_{k}}, \overline{1}\right\}\right) \sqcup\{2, \overline{0}, \overline{0}\}$. By (191), $\left(\left[r \tilde{\mathrm{C}}^{\prime}\right]_{0},\left[l \tilde{\mathrm{C}}^{\prime}\right]_{0}\right)=(\{1,2\},\{2, \overline{1}\})$. It follows from $f_{0} \tilde{\mathrm{C}}=\left(\tilde{\mathrm{C}} \backslash\left\{z_{k}, \overline{z_{k}}, \overline{1}\right\}\right) \sqcup\{2, \overline{0}, \overline{0}\}$ that $\mathrm{C}^{\prime}=\left(\mathrm{C} \backslash\left\{z_{k}, \overline{z_{k}}, \overline{1}\right\}\right) \sqcup\{2\}, I_{\mathrm{C}^{\prime}}=I_{\mathrm{C}} \backslash\left\{z_{k}\right\}$, $J_{\mathrm{C}^{\prime}}=J_{\mathrm{C}} \backslash\{2\}$, and $K_{f_{0} \tilde{\mathrm{C}}}=K_{\tilde{\mathrm{C}}} \sqcup\left\{1, z_{k}\right\}$. By (195), $\Phi_{i}\left(f_{0} \tilde{\mathrm{C}}\right)=\left(r \tilde{\mathrm{C}}^{\prime}, l \tilde{\mathrm{C}}^{\prime}\right)$.

Case 6. Assume that $[\tilde{\mathrm{C}}]_{0}=\{1,2\}$. By (150)-(152), $f_{0} \tilde{\mathrm{C}}=\mathbf{0}$. It follows from $[\tilde{\mathrm{C}}]_{0}=$ $\{1,2\}$ and (196) that $1,2 \in\|\mathrm{C}\| \backslash I_{\mathrm{C}}$ and $\left([r \tilde{\mathrm{C}}]_{0},[l \tilde{\mathrm{C}}]_{0}\right)=(\{1,2\},\{1,2\})$. By (192), $f_{0}(r \tilde{\mathrm{C}}, l \tilde{\mathrm{C}})=\mathbf{0}$.
Case 7. Assume that $[\tilde{\mathrm{C}}]_{0}=\{1, \overline{2}\}$. By $(150)-(152), f_{0} \tilde{\mathrm{C}}=\mathbf{0}$. It follows from $[\tilde{\mathrm{C}}]_{0}=$ $\{1, \overline{2}\}$ and (196) that $1,2 \in\|\mathrm{C}\| \backslash I_{\mathrm{C}}$ and $\left([r \tilde{\mathrm{C}}]_{0},[l \tilde{\mathrm{C}}]_{0}\right)=(\{1, \overline{2}\},\{1, \overline{2}\})$. By (192), $f_{0}(r \tilde{\mathrm{C}}, l \tilde{\mathrm{C}})=\mathbf{0}$.
Case 8. Assume that $[\tilde{\mathrm{C}}]_{0}=\{2, \overline{2}\}$. By (150)-(152), $f_{0} \tilde{\mathrm{C}}=\mathbf{0}$. It follows from $[\tilde{\mathrm{C}}]_{0}=$ $\{2, \overline{2}\}$ that $2=z_{k} \in I_{\mathrm{C}}, 1=y_{k} \in J_{\mathrm{C}}$, and $\left([r \tilde{\mathrm{C}}]_{0},[l \tilde{\mathrm{C}}]_{0}\right)=(\{2, \overline{1}\},\{1, \overline{2}\})$. By (192), $f_{0}(r \tilde{\mathrm{C}}, l \tilde{\mathrm{C}})=\mathbf{0}$.

Case 9. Assume that $[\tilde{\mathrm{C}}]_{0}=\{2, \overline{1}\}$. By (150)-(152), $f_{0} \tilde{\mathrm{C}}=\mathbf{0}$. It follows from $[\tilde{\mathrm{C}}]_{0}=$ $\{2, \overline{1}\}$ and (196) that $1,2 \in\|\mathrm{C}\| \backslash I_{\mathrm{C}}$ and $\left([r \tilde{\mathrm{C}}]_{0},[l \tilde{\mathrm{C}}]_{0}\right)=(\{2, \overline{1}\},\{2, \overline{1}\})$. By (192), $f_{0}(r \tilde{\mathrm{C}}, l \tilde{\mathrm{C}})=\mathbf{0}$.
Case 10. Assume that $[\tilde{\mathrm{C}}]_{0}=\{\overline{2}, \overline{1}\}$. By (150)-(151), $f_{0} \tilde{\mathrm{C}}=(\tilde{\mathrm{C}} \backslash\{\overline{2}, \overline{1}\}) \sqcup\{\overline{\mathrm{O}}, \overline{0}\}$. It follows from $[\tilde{\mathrm{C}}]_{0}=\{\overline{2}, \overline{1}\}$ and $(196)$ that $1,2 \in\|\mathrm{C}\| \backslash I_{\mathrm{C}}$ and $\left([r \tilde{\mathrm{C}}]_{0},[l \tilde{\mathrm{C}}]_{0}\right)=$ $(\{\overline{2}, \overline{1}\},\{\overline{2}, \overline{1}\})$. By (191), $\left(\left[r \tilde{\mathrm{C}}^{\prime}\right]_{0},\left[l \tilde{\mathrm{C}}^{\prime}\right]_{0}\right)=(\{1,2\},\{\overline{2}, \overline{1}\})$. It follows from $f_{0} \tilde{\mathrm{C}}=(\tilde{\mathrm{C}}$ $\{\overline{2}, \overline{1}\}) \sqcup\{\overline{0}, \overline{0}\}$ that $\mathrm{C}^{\prime}=\mathrm{C} \backslash\{\overline{2}, \overline{1}\}, I_{\mathrm{C}^{\prime}}=I_{\mathrm{C}}, J_{\mathrm{C}^{\prime}}=J_{\mathrm{C}}$, and $K_{f_{0} \tilde{\mathrm{C}}}=K_{\tilde{\mathrm{C}}} \sqcup\{1,2\}$. By (195), $\Phi_{i}\left(f_{0} \tilde{\mathrm{C}}\right)=\left(r \tilde{\mathrm{C}}^{\prime}, l \tilde{\mathrm{C}}^{\prime}\right)$.

The proof is complete.
