# The Affine Frame in p-adic Analysis 

Ming Gen Cui<br>Huan Min Yao<br>Huan Ping Liu

#### Abstract

In this paper, we will introduce the concept of affine frame in wavelet analysis to the field of p-adic number, hence provide new mathematic tools for application of p-adic analysis.

## 1 Introduction

The concept of affine frame was introduced to wavelet analysis at first in reference [2]. And the theory of affine frame was studied in reference [3] and [4] further. In this paper, we introduce the concept of affine frame in wavelet analysis to the field of p-adic number as the discrete formula of wavelet transform. Before now, we have introduced the wavelet transform to the field of p-adic analysis([1]). General knowledge on p-adic analysis see [6].

It is known that if $x=p^{r} \sum_{k=0}^{n} x_{k} p^{-k} \in R^{+} \cup\{0\}, x_{0} \neq 0.0 \leq x_{k} \leq$ $p-1, k=1,2, \cdots$, then there is another expression for $x$.

$$
\begin{equation*}
x=p^{r}\left(\sum_{k=0}^{n-1} x_{k} p^{-k}+\left(x_{n}-1\right) p^{-n}+(p-1) \sum_{k=n+1}^{\infty} p^{-k}\right) \tag{1.1}
\end{equation*}
$$

We don't adopt this expression. Let $M_{R}$ be the set of numbers in the form of (1.1). An mapping $\rho$ was introduced in reference [5], which $\rho: \mathbf{Q}_{\mathbf{p}} \rightarrow$ $R^{+} \cup\{0\}$, for $x=p^{-r} \sum_{x=0}^{\infty} x_{k} p^{k}, x_{0} \neq 0,0 \leq p-1, k=1,2, \cdots$

$$
\begin{equation*}
\rho(x)=p^{-r-l} \sum_{k=0}^{\infty} x_{k} p^{-k} \tag{1.2}
\end{equation*}
$$

For $a_{R}, b_{R} \in R^{+} \cup\{0\}$, mapping (1.2) follows that

$$
b_{R}-a_{R}=\mu\left(\left[a_{p}, b_{p}\right]\right), a_{p}=\rho^{-1}\left(a_{R}\right), b_{p}=\rho^{-1}\left(b_{R}\right)
$$

M.G. Cui, H.M. Yao and H.P. Liu

and then we have the following lemma.
Lemma 1.1: Let $f\left(x_{p}\right) \in L^{2}\left(Q_{p}\right)$ and $f_{R}\left(x_{R}\right) \stackrel{\text { def }}{=} f\left(\rho\left(x_{p}\right)\right), x_{p} \in Q_{p}, x_{R}=$ $\rho\left(x_{p}\right)$ then

$$
\int_{a_{p}}^{b_{p}} f\left(x_{p}\right) \mathrm{d} x_{p}=\int_{a_{R}}^{b_{R}} f_{R}\left(x_{R}\right) \mathrm{d} x_{R},
$$

where $a_{R}=\rho\left(a_{p}\right), b_{R}=\rho\left(b_{p}\right)$.
Remark: $\mu\left\{\left[a_{p}, b_{p}\right]\right\}$ is defined as the infimum of measure of all the disjoint discs covering $\left\{B_{r_{i}}\left(a_{i}\right)\right\}$ for interval $\left[a_{p}, b_{p}\right]$, and for complex-valued function $f$, the integral of $f$ is defined by

$$
\int_{\left[a_{p}, b_{p}\right]} f \mathrm{~d} x_{p} \stackrel{\text { def }}{=} \inf _{\left\{B_{r_{i}}\left(a_{i}\right)\right\}} \sum_{i} f\left(a_{i}\right) \mu\left(B_{r_{i}}\left(a_{i}\right)\right) .
$$

## 2 The Frame in $L^{2}\left(\mathbf{Q}_{\mathbf{p}}\right)$

Let $f, h \in L^{2}\left(\mathbf{Q}_{\mathbf{p}}\right)$. The following we will discuss conditions of $\left\{h_{m, n}\right\}$ becomes to the frame of $L^{2}\left(\mathbf{Q}_{\mathbf{p}}\right)$. Here, the so-called frame defined as: $\exists A, B>0$ such that

$$
A\|f\|_{L^{2}\left(\mathbf{Q}_{\mathbf{P}}\right)}^{2} \leq \sum_{m, n}\left|\left(f, h_{m n}\right)\right|_{L^{2}\left(\mathbf{Q}_{\mathbf{P}}\right)}^{2} \leq B\|f\|_{L^{2}\left(\mathbf{Q}_{\mathbf{P}}\right)}^{2}
$$

where

$$
\begin{aligned}
\|f\|_{L^{2}\left(\mathbf{Q}_{\mathbf{P}}\right)}^{2} & =\int_{\mathbf{Q}_{\mathbf{P}}}|f|^{2} \mathrm{~d} x_{p} \\
\left(f, h_{m n}\right)_{L^{2}\left(\mathbf{Q}_{\mathbf{P}}\right)} & =\int_{\mathbf{Q}_{\mathbf{P}}} f \bar{h}_{m n} \mathrm{~d} x_{p}
\end{aligned}
$$

It is known that if $\left\{h_{m n}\right\}$ is the frame of $L^{2}\left(Q_{p}\right)$, then the function $f \in$ $L^{2}\left(\mathbf{Q}_{\mathbf{p}}\right)$ can be express as

$$
\begin{equation*}
f\left(x_{p}\right)=\sum_{m, n}\left(f, h_{m n}^{*}\right)_{L^{2}\left(\mathbf{Q}_{\mathbf{P}}\right)} h_{m n}\left(x_{p}\right)=\sum_{m, n}\left(f, h_{m n}\right)_{L^{2}\left(\mathbf{Q}_{\mathbf{P}}\right)} h_{m n}^{*} \tag{2.1}
\end{equation*}
$$

here $h_{m n}^{*}=S^{-1} h_{m n}$ is the dual frame of $h_{m n}$, and $S: L^{2}\left(\mathbf{Q}_{\mathbf{p}}\right) \rightarrow L^{2}\left(\mathbf{Q}_{\mathbf{p}}\right)$ is the frame operator.

$$
S f=\sum_{m, n}\left(f, h_{m n}\right)_{L^{2}\left(\mathbf{Q}_{\mathbf{P}}\right)} h_{m n}
$$

## The Affine Frame In p-adic Analysis

Theorem2.1. Let $f, h \in L^{2}\left(\mathbf{Q}_{\mathbf{p}}\right)$ be complex-value function, and $h(0)=$ $0, x_{R}=\rho\left(x_{p}\right), x_{p} \in Q_{p} \backslash M$, here $M=\rho^{-1}\left(M_{R}\right)$, and measure of set $M$ be equal to 0 . Select $b_{0}=p^{r\left(b_{0}\right)}, r\left(b_{0}\right) \in \mathbf{Z}, a_{0}=p^{r\left(a_{0}\right)}, r\left(a_{0}\right) \in \mathbf{Z}$. If
(1) $\exists A, B>0$ such that for $\omega \neq 0$

$$
A \leq G(\omega) \stackrel{\text { def }}{=} \sum_{m \in \mathbf{Z}}\left|\widehat{h}_{1}\left(\frac{\omega}{a_{0}^{m}}\right)\right|^{2} \leq B,
$$

(2) $\operatorname{supp} \widehat{h}_{1} \subset\left[-\frac{1}{2 b_{0}}, \frac{1}{2 b_{0}}\right]$
then

$$
\left\{h_{m n}\left(x_{p}\right) \stackrel{\text { def }}{=} a_{0}^{m / 2} h\left(\frac{\alpha_{n}^{(m)}\left(x_{p}\right)-x_{p}}{a_{0}^{-m}}\right)\right\}_{n, m \in \mathbf{Z}}
$$

is a frame of $L^{2}\left(\mathbf{Q}_{\mathbf{p}}\right)$, where

$$
\alpha_{n}^{(m)}\left(x_{p}\right)= \begin{cases}\rho^{-1}\left(x_{R}+a_{0}^{-m} n b_{0}\right)+x_{p}, & x_{R}+a_{0}^{-m} n b_{0}>0 \\ x_{p}, & x_{R}+a_{0}^{-m} n b_{0} \leq 0\end{cases}
$$

the sign ${ }^{\wedge}$ denotes the Fourier transform

$$
\widehat{f}(w)=\int_{R} f(x) e^{-2 \pi i \omega x} \mathrm{~d} x
$$

and $h_{1}$ is defined from(2.3).
Proof. From the definition of $\alpha_{n}^{(m)}\left(x_{p}\right)$, we have

$$
\begin{align*}
(S f, f)_{L^{2}\left(Q_{p}\right)} & =\sum_{m, n \in \mathbf{Z}}\left|\left(f, h_{m n}\right)_{L^{2}\left(Q_{p}\right)}\right|^{2} \\
& =\sum_{m, n \in \mathbf{Z}} a_{0}^{m}\left|\int_{Q_{p} \backslash M} f\left(x_{p}\right) h\left\{\frac{\alpha_{n}^{(m)}\left(x_{p}\right)-x_{p}}{a_{0}^{-m}}\right\} \mathrm{d} x_{p}\right|^{2} \\
& =\sum_{m, n \in \mathbf{Z}} a_{0}^{m}\left|\int_{\mathbf{R}^{+} \cup\{\mathbf{0}\}} f_{R}\left(x_{R}\right) h_{1}\left\{\frac{x_{R}+a_{0}^{-m} n b_{0}}{a_{0}^{-m}}\right\} \mathrm{d} x_{R}\right|^{2} \tag{2.2}
\end{align*}
$$

where $x_{R}=\rho\left(x_{p}\right), x_{p} \in Q_{p} \backslash M, f_{R}\left(x_{R}\right)=f\left(\rho^{-1}\left(x_{R}\right)\right)$,

$$
h_{1}\left(x_{R}\right)= \begin{cases}h\left(\rho^{-1} x_{R}\right), & x_{R}>0  \tag{2.3}\\ h(0), & x_{R} \leq 0\end{cases}
$$

M.G. Cui, H.M. Yao and H.P. Liu

Let

$$
f_{R}^{+}\left(x_{R}\right)= \begin{cases}f_{R}\left(x_{R}\right), & x_{R} \geq 0 \\ 0, & x_{R}<0\end{cases}
$$

Thus, from(2.2), the following equalities hold

$$
\begin{align*}
& \sum_{m, n \in Z}\left|\left(f, h_{m n}\right)_{L^{2}\left(Q_{p}\right)}\right|^{2} \\
= & \sum_{m, n \in Z} a_{0}^{m}\left|\int_{R} f_{R}^{+}\left(x_{R}\right) h_{1}\left(\frac{x_{R}+a_{0}^{-m} n b_{0}}{a_{0}^{-m}}\right) \mathrm{d} x_{R}\right|^{2} \\
= & \sum_{m, n \in Z} a_{0}^{-m}\left|\int_{R} \widehat{f_{R}^{+}}(\omega) \widehat{h_{1}}\left(\frac{\omega}{a_{0}^{m}}\right) \exp \left(2 \pi i a_{0}^{-m} n b_{0} \omega\right) \mathrm{d} \omega\right|^{2} \\
= & \sum_{m, n \in Z} a_{0}^{-m}\left|\int_{-\frac{a_{0}^{m}}{2 b_{0}}}^{\frac{a_{0}^{m}}{2 b_{0}}} \widehat{f}_{R}^{+}(\omega) \widehat{h}_{1}\left(\frac{\omega}{a_{0}^{m}}\right) \exp \left(2 \pi i a_{0}^{-m} n b_{0} \omega\right) \mathrm{d} \omega\right|^{2} \tag{2.4}
\end{align*}
$$

In the last equality, we used $\operatorname{supp} \widehat{h_{1}} \subset\left[-\frac{a_{0}^{m}}{2 b_{0}}, \frac{a_{0}^{m}}{2 b_{0}}\right]$. But

$$
\frac{1}{a_{0}^{m} / b_{0}} \int_{-\frac{a_{0}^{m}}{2 b_{0}}}^{\frac{a_{0}^{m}}{2 b_{0}}} \widehat{f_{R}^{+}}(\omega) \widehat{h_{1}}\left(\frac{\omega}{a_{0}^{m}}\right) \exp \left(2 \pi i a_{0}^{-m} n b_{0} \omega\right) \mathrm{d} \omega
$$

is the Fourier coefficient of the function $\widehat{f_{R}^{+}}(\omega) \widehat{h_{1}}\left(\frac{\omega}{a_{0}^{m}}\right)$. Denotes this coefficient by $c_{-n}$. By the Parseval equality, we have

$$
\begin{align*}
\sum_{n \in \mathbf{Z}}\left|c_{n}\right|^{2}= & \frac{1}{a_{0}^{2 m} / b_{0}^{2}} \sum_{n \in \mathbf{Z}}\left|\int_{-\frac{a_{0}^{m}}{2 b_{0}}}^{\frac{a_{0}^{m}}{2 b_{0}}} \widehat{f_{R}^{+}}(\omega) \widehat{h_{1}}\left(\frac{\omega}{a_{0}^{m}}\right) \exp \left(2 \pi i a_{0}^{-m} n b_{0} \omega\right) \mathrm{d} \omega\right|^{2} \\
& =\frac{b_{0}}{a_{0}^{m}} \int_{-\frac{a_{0}^{m}}{2 b_{0}}}^{\frac{a_{0}^{m}}{2 b_{0}}}\left|\widehat{f_{R}^{+}}(\omega) \widehat{h_{1}}\left(\frac{\omega}{a_{0}^{m}}\right)\right|^{2} \mathrm{~d} \omega \tag{2.5}
\end{align*}
$$

By (2.4), we have

$$
\sum_{m, n \in Z}\left|\left(f, h_{m n}\right)_{L^{2}\left(Q_{p}\right)}\right|^{2}=\left.\frac{1}{b_{0}} \sum_{m \in \mathbf{Z}} \int_{-\frac{a_{0}^{m}}{2 b_{0}}} \begin{gathered}
\frac{a_{0}^{m}}{2 b_{0}}
\end{gathered} \widehat{f_{R}^{+}}(\omega) \widehat{h_{1}}\left(\frac{\omega}{a_{0}^{m}}\right)\right|^{2} \mathrm{~d} \omega
$$

The Affine Frame In p-Adic Analysis

$$
\begin{equation*}
=\frac{1}{b_{0}} \int_{R}\left|\widehat{f_{R}^{+}}(\omega)\right|^{2}\left|\widehat{h_{1}}\left(\frac{\omega}{a_{0}^{m}}\right)\right|^{2} \mathrm{~d} \omega \tag{2.6}
\end{equation*}
$$

Here

$$
\begin{equation*}
G(\omega)=\sum_{m \in Z}\left|\widehat{h_{1}}\left(\frac{\omega}{a_{0}^{m}}\right)\right|^{2} \tag{2.7}
\end{equation*}
$$

Finally, by the condition of theorem $0<A \leq|G(\omega)|^{2} \leq B$ and formula (2.6), we have

$$
\sum_{m, n \in Z}\left|\left(f, h_{m n}\right)_{L^{2}\left(Q_{p}\right)}\right|^{2}=\left\{\begin{array}{l}
\geq \frac{1}{b_{0}} A \int_{R}\left|\widehat{f}_{R}^{+}(\omega)\right|^{2} \mathrm{~d} \omega \\
\leq \frac{1}{b_{0}} B \int_{R}\left|\hat{f}_{R}^{+}(\omega)\right|^{2} \mathrm{~d} \omega
\end{array}\right.
$$

But

$$
\begin{aligned}
\int_{R}\left|\widehat{f}_{R}^{+}(\omega)\right|^{2} \mathrm{~d} \omega=\int_{R}\left|f_{R}^{+}\left(x_{R}\right)\right|^{2} \mathrm{~d} x_{R}=\int_{R^{+} \cup\{0\}}\left|f_{R}\left(x_{R}\right)\right|^{2} \mathrm{~d} x_{R} & =\int_{Q_{p}}\left|f\left(x_{p}\right)\right|^{2} \mathrm{~d} x_{p} \\
& =\|f\|_{L^{2}\left(Q_{p}\right)}^{2}
\end{aligned}
$$

Hence, the theorem follows.

## 3 Dual frame $h_{m n}^{*}$

It is known that if $\left\{h_{m n}\right\}_{m n}$ construct a frame of $L^{2}\left(Q_{p}\right)$, then expression (2.1) is valid. From (2.6), we have

$$
\begin{align*}
(S f, f)_{L^{2}\left(Q_{p}\right)} & =\frac{1}{b_{0}} \int_{R}\left|\widehat{f}_{R}^{+}(\omega)\right|^{2} G(\omega) \mathrm{d} \omega \\
& =\frac{1}{b_{0}} \int_{R}\left(\widehat{f_{R}^{+}} G\right)^{\vee}\left(x_{R}\right) \bar{f}_{R}^{+}\left(x_{R}\right) \mathrm{d} x_{R} \\
& =\frac{1}{b_{0}} \int_{R^{+} \cup\{0\}}\left(\widehat{f}_{R}^{+} G\right)^{\vee}\left(x_{R}\right) \bar{f}_{R}\left(x_{R}\right) \mathrm{d} x_{R} \\
& =\frac{1}{b_{0}} \int_{Q_{p}}\left(\widehat{f_{R}^{+}} G\right)^{\vee}\left(\rho\left(x_{p}\right)\right) \bar{f}\left(x_{p}\right) \mathrm{d} x_{p} \tag{3.1}
\end{align*}
$$

where $x_{p}=\rho^{-1}\left(x_{R}\right), x_{R} \in R^{+} \cup\{0\}$, and " $\vee$ " is the sign of Fourier inverse transform. Here, we use lemma A.
(3.1) can be rewritten as

$$
\begin{equation*}
(S f, f)_{L^{2}\left(Q_{p}\right)}=\frac{1}{b_{0}}\left(\left(\hat{f}_{R}^{+} G\right)^{\vee}\left(\rho\left(x_{p}\right)\right), f\left(x_{p}\right)\right)_{L^{2}\left(Q_{p}\right)} \tag{3.2}
\end{equation*}
$$

Since $f$ is an arbitrary function in $Q_{p}$,

$$
\begin{equation*}
(S f)\left(x_{p}\right)=\frac{1}{b_{0}}\left(\hat{f}_{R}^{+} G\right)^{\vee}\left(\rho\left(x_{p}\right)\right) \tag{3.3}
\end{equation*}
$$

or for $x \in R^{+} \cup\{0\}$, we conclude that

$$
\begin{equation*}
(S f)_{R}\left(x_{R}\right)=\frac{1}{b_{0}}\left(\hat{f}_{R}^{+} G\right)^{\vee}\left(x_{R}\right),(S f)_{R}=S\left(f \circ \rho^{-1}\right) \tag{3.4}
\end{equation*}
$$

On the basis of formula (3.4), we can extend the domain of function $(S f)_{R}\left(x_{R}\right)$ onto $R$. Therefore

$$
\begin{equation*}
(S f)_{R}^{\wedge}(\omega)=\frac{1}{b_{0}} \widehat{f_{R}^{+}}(\omega) G(\omega), \omega \in R^{+} \cup\{0\} \tag{3.5}
\end{equation*}
$$

Replacing $f$ by $S^{-1} f$ in the formula (3.5), we have

$$
\widehat{f_{R}}\left(\omega_{R}\right)=\frac{1}{b_{0}}\left(\widehat{\left.S^{-1} f\right)_{R}^{+}}(\omega) G(\omega)\right.
$$

Thus

$$
\left(\widehat{\left.S^{-1} f\right)_{R}^{+}}\left(\omega_{R}\right)=\frac{b_{0} \widehat{f_{R}}(\omega)}{G(\omega)}\right.
$$

or

$$
\left(S^{-1} f\right)_{R}^{+}\left(x_{R}\right)=b_{0}\left\{\frac{\widehat{f_{R}}}{G}\right\}^{\vee}\left(x_{R}\right)
$$

For $x_{R} \geq 0$, we have

$$
\left(S^{-1} f\right)_{R}\left(x_{R}\right)=b_{0}\left\{\frac{\widehat{f_{R}}}{G}\right\}^{\vee}\left(x_{R}\right)
$$

or

$$
\left(S^{-1} f\right)\left(x_{p}\right)=b_{0}\left(\frac{\widehat{f_{R}}}{G}\right)^{\vee}\left(\rho\left(x_{p}\right)\right)
$$

So for $f_{R}\left(x_{R}\right), x_{R} \geq 0,\left(S^{-1} f\right)\left(x_{p}\right)=b_{0}\left[f_{R} *\left(G^{-1}\right)^{\vee}\right]$ is valid. Finally, We have

$$
h_{m n}^{*}\left(x_{p}\right)=b_{0}\left[\left(h_{m n}\right)_{R} *\left(G^{-1}\right)^{\vee}\right]\left(\rho\left(x_{p}\right)\right),
$$

where the $\operatorname{sign} *$ denotes convolution.
