## On certain useful vectors in differential geometry

by
C. E.. Weatherburn

Perth W.A.

1. Definitions. We propose to consider briefly a set of vectors, by means of which some of the formulae and proofs of elementary Differential Geometry of a surface in Euclidean 3 -space are considerably simplified. The position vector $\mathbf{r}$ of the current point on the surface is a function of two parameters, $u$ and $v$. Let suffixes 1,2 denote differentiations with respect to $u, v$ respectively. Thus

$$
\mathbf{r}_{1}=\frac{\partial \mathbf{r}}{\partial u}, \quad \mathbf{r}_{2}=\frac{\partial \mathbf{r}}{\partial v}
$$

and the unit normal vector $\mathbf{n}$ to the surface at the point considered is such that $\mathbf{n}=\frac{\mathbf{r}_{1} \times \mathbf{r}_{2}}{H}$, where $H^{2}=E G-F^{2}, E, F, G$ being fundamental magnitudes of the first order for the surface. Then the scalar triple product

$$
\left[\mathbf{r}_{1}, \mathbf{r}_{2}, \mathbf{n}\right]=H \mathbf{n} \cdot \mathbf{n}=H
$$

and the reciprocal system of vectors ${ }^{1}$ ) to $\mathbf{r}_{1}, \mathbf{r}_{2}, \mathbf{n}$ is the system

$$
\frac{\mathbf{r}_{2} \times \mathbf{n}}{H}, \quad \frac{\mathbf{n} \times \mathbf{r}_{1}}{H}, \quad \frac{\mathbf{r}_{1} \times \mathbf{r}_{2}}{H} .
$$

The third of these is clearly $\mathbf{n}$. The first and second we shall denote by $\mathbf{p}$ and $\mathbf{q}$. Thus

$$
\left\{\begin{array}{l}
H^{2} \mathbf{p}=\mathbf{r}_{2} \times\left(\mathbf{r}_{1} \times \mathbf{r}_{2}\right)=G \mathbf{r}_{1}-F \mathbf{r}_{2}  \tag{1}\\
H^{2} \mathbf{q}=\left(\mathbf{r}_{1} \times \mathbf{r}_{2}\right) \times \mathbf{r}_{1}=E \mathbf{r}_{2}-F \mathbf{r}_{1}
\end{array}\right.
$$

and these vectors are, of course, tangential to the surface. It is casily verified that

$$
\begin{equation*}
\mathbf{p}^{2}=\frac{G}{H^{2}}, \quad \mathbf{q}^{2}=\frac{E}{H^{2}}, \quad \mathbf{p} \cdot \mathbf{q}=-\frac{F}{H^{2}}, \tag{2}
\end{equation*}
$$

[^0]while from their definitions it follows that
\[

\left\{$$
\begin{array}{c}
\mathbf{p} \cdot \mathbf{r}_{1}=\mathbf{1}, \quad \mathbf{q} \cdot \mathbf{r}_{2}=\mathbf{1}  \tag{3}\\
\mathbf{0}=\mathbf{p} \cdot \mathbf{r}_{2}=\mathbf{q} \cdot \mathbf{r}_{1}=\mathbf{p} \cdot \mathbf{n}=\mathbf{q} \cdot \mathbf{n}
\end{array}
$$\right.
\]

2. Derivatives of Vectors. In terms of $\mathbf{p}$ and $\mathbf{q}$ the derivatives ${ }^{2}$ ) of $\mathbf{n}$ with respect to $u, v$ are given very compactly by the equations

$$
\left\{\begin{array}{l}
\mathbf{n}_{1}=-L \mathbf{p}-M \mathbf{q}  \tag{4}\\
\mathbf{n}_{2}=-M \mathbf{p}-N \mathbf{q}
\end{array}\right.
$$

$L, M, N$ being the fundamental magnitudes of the second order. The second derivatives of $\mathbf{r}$ with respect to $u$ and $v$, when expressed in terms of $\mathbf{n}, \mathbf{r}_{1}, \mathbf{r}_{2}$, involve as coefficients certain functions usually denoted by the Christoffel symbols. In terms of the reciprocal system of vectors, however, these derivatives may be simply expressed

$$
\left\{\begin{array}{l}
\mathbf{r}_{11}=L \mathbf{n}+\frac{1}{2} E_{1} \mathbf{p}+\left(F_{1}-\frac{1}{2} E_{2}\right) \mathbf{q}  \tag{5}\\
\mathbf{r}_{12}=M \mathbf{n}+\frac{1}{2} E_{2} \mathbf{p}+\frac{1}{2} G_{1} \mathbf{q} \\
\mathbf{r}_{22}=N \mathbf{n}+\left(F_{2}-\frac{1}{2} G_{1}\right) \mathbf{p}+\frac{1}{2} G_{2} \mathbf{q}
\end{array}\right.
$$

To prove the first of these we observe that the coefficient of $\mathbf{p}$ in the expression for $\mathbf{r}_{11}$ must, in virtue of (3), have the value

$$
\mathbf{r}_{11} \cdot \mathbf{r}_{1}=\frac{1}{2} \frac{\partial}{\partial u}\left(\mathbf{r}_{1}^{2}\right)=\frac{1}{2} E_{1}
$$

Similarly the coefficient of $\mathbf{q}$ must have the value

$$
\mathbf{r}_{11} \cdot \mathbf{r}_{2}=\frac{\partial}{\partial u}\left(\mathbf{r}_{1} \cdot \mathbf{r}_{2}\right)-\frac{1}{2} \frac{\partial}{\partial v}\left(\mathbf{r}_{1}^{2}\right)=F_{1}-\frac{1}{2} E_{2}
$$

and likewise for the others. The above formulae (5) should be compared with the usual ${ }^{3}$ )

$$
\left\{\begin{array}{l}
\mathbf{r}_{11}=L \mathbf{n}+l \mathbf{r}_{1}+\lambda \mathbf{r}_{2}  \tag{6}\\
\mathbf{r}_{12}=M \mathbf{n}+m \mathbf{r}_{1}+\mu \mathbf{r}_{2} \\
\mathbf{r}_{22}=N \mathbf{n}+n \mathbf{r}_{1}+\nu \mathbf{r}_{2}
\end{array}\right.
$$

whose coefficients $l, m, n, \lambda, \mu, \nu$, when expressed in terms of $E, F, G$, are much less simple than those in (5).

[^1]The derivatives of $\mathbf{p}$ and $\mathbf{q}$ with respect to $u, v$ are given by

$$
\left\{\begin{array}{l}
H^{2} \mathbf{p}_{1}=(G L-F M) \mathbf{n}-H^{2}(l \mathbf{p}+m \mathbf{q})  \tag{7}\\
H^{2} \mathbf{p}_{2}=(G M-F N) \mathbf{n}-H^{2}(m \mathbf{p}+n \mathbf{q}) \\
H^{2} \mathbf{q}_{1}=(E M-F L) \mathbf{n}-H^{2}(\lambda \mathbf{p}+\mu \mathbf{q}) \\
H^{2} \mathbf{q}_{2}=(E N-F M) \mathbf{n}-H^{2}(\mu \mathbf{p}+\nu \mathbf{q})
\end{array}\right.
$$

To verify these take, for instance, the coefficient of $\mathbf{p}$ in the first. In virtue of (3) this must have the value

$$
\mathbf{p}_{1} \cdot \mathbf{r}_{1}=\frac{\partial}{\partial u}\left(\mathbf{p} \cdot \mathbf{r}_{1}\right)-\mathbf{p} \cdot \mathbf{r}_{11}=-l
$$

by (6) and similarly for the others.
3. Differential Invariants. In terms of $\mathbf{p}$ and $\mathbf{q}$ the surface gradient ${ }^{4}$ ) $\nabla \varphi$, of a scalar point-functions $\varphi$, is simply

$$
\begin{equation*}
\nabla \varphi=\mathbf{p} \frac{\partial \varphi}{\partial u}+\mathbf{q} \frac{\partial \varphi}{\partial v} \tag{8}
\end{equation*}
$$

and the surface divergence and rotation ${ }^{5}$ ) of a vector $h$ are

$$
\left\{\begin{array}{l}
\operatorname{div} \mathbf{h}=\mathbf{p} \cdot \mathbf{h}_{1}+\mathbf{q} \cdot \mathbf{h}_{2}  \tag{9}\\
\operatorname{rot} \mathbf{h}=\mathbf{p} \times \mathbf{h}_{1}+\mathbf{q} \times \mathbf{h}_{\mathbf{2}}
\end{array}\right.
$$

As an illustration of the use of these we observe that they give immediately, in virtue of (4),

$$
\operatorname{div} \mathbf{n}=\frac{(2 F M-E N-G L)}{H^{2}}=-J, \quad \operatorname{rot} \mathbf{n}=0
$$

where $J$ is the first curvature of the surface. Also the surface Laplacian of $\mathbf{r}$, (or the differential parameter of $\mathbf{r}$ of the second order), is ${ }^{6}$ )

$$
\nabla^{2} \mathbf{r}=\frac{\mathbf{1}}{H} \frac{\partial}{\partial u}(H \mathbf{p})+\frac{\mathbf{1}}{H} \frac{\partial}{\partial v}(H \mathbf{q})=\mathbf{p}_{1}+\mathbf{q}_{2}+\frac{\mathbf{1}}{H}\left(H_{1} \mathbf{p}+H_{2} \mathbf{q}\right)=J \mathbf{n}
$$

in virtue of (7).
Again, if a vector $\mathbf{F}$ is expressed as a sum of components in the directions of $\mathbf{p}, \mathbf{q}, \mathbf{n}$ in the form $\mathbf{F}=P \mathbf{p}+Q \mathbf{q}+R \mathbf{n}$, it is easily verified that

$$
\begin{equation*}
\mathbf{n} \cdot \operatorname{rot} \mathbf{F}=\frac{1}{H}\left(Q_{1}-P_{2}\right) \tag{10}
\end{equation*}
$$

${ }^{4}$ ) D. G., 223.
$\left.{ }^{5}\right)$ D. G., 225, 228.
$\left.{ }^{6}\right)$ D. G., 231.

This leads to a short proof of the Circulation Theorem ${ }^{7}$ ) for a closed curve on the surface, viz.

$$
\begin{equation*}
\iint \mathbf{n} \cdot \operatorname{rot} \mathbf{F} d S=\oint \mathbf{F} \cdot d \mathbf{r} \tag{11}
\end{equation*}
$$

where the surface integral is taken over the enclosed region of the surface, and the line integral round the boundary. For the first member of (11) has the value

$$
\iint\left(Q_{1}-P_{2}\right) d u d v=\oint Q d v+\oint P d u
$$

as in the writer's Differential Geometry, Vol 1, 243; and this may be written

$$
\oint(P \mathbf{p}+Q \mathbf{q}+R \mathbf{n}) \cdot\left(\mathbf{r}_{1} d u+\mathbf{r}_{2} d v\right)=\oint \mathbf{F} \cdot d \mathbf{r}
$$

as required.
