# THE CYLINDER HOMOMORPHISM ASSOCIATED TO QUINTIC FOURFOLDS 

James D. Lewis

## §0. Introduction

Let $X$ be a quintic fourfold (smooth hypersurface of degree 5 in $\mathbb{P}^{5}$ ), and $\Omega_{X}$ the variety of lines in $X$. According to [1], if $X$ is generically chosen, then $\Omega_{X}$ is a smooth surface. Let $\Phi_{*}: H_{2}\left(\Omega_{X}, \mathbb{Q}\right) \rightarrow H_{4}(X, \mathbb{Q})$ be the "cylinder homorphism" obtained by blowing up each point on $\gamma \in \mathrm{H}_{2}\left(\Omega_{X}, \mathbb{Q}\right)$ to a corresponding line in $X$ (thus sweeping out a 4 cycle in $X$ ). This homomorphism was studied in [4], and in particular, viewing $\Phi_{*}$ on cohomology (viz Poincaré duality):
(0.1) Theorem: ([4; (4.4)]). Let $X$ be generic, $\omega \in H^{1,1}(X, \mathbb{Q})$ the Kähler class dual to the hyperplane section of $X$. Then $\Phi_{*}: H^{2}\left(\Omega_{X}, \mathbb{Q}\right) \rightarrow$ $H^{4}(X, \mathbb{Q}) / \mathbb{Q} \omega \wedge \omega$ is an epimorphism.

For relatively elementary reasons (see (5.5)), it is also true that $\Phi_{*}$ : $H^{2}\left(\Omega_{X}, \mathbb{Q}\right) \rightarrow H^{4}(X, \mathbb{Q})$ is an epimorphism for generic $X$. This paper is devoted to the answering of the following question:

$$
\text { (0.2) What is the kernel of } \Phi_{*} \text { ? }
$$

In order to satisfactorily answer (0.2), some terminology has to be introduced. The family of hypersurfaces $\left\{X_{v}\right\}_{v \in \mathbb{P}^{N}}$ of degree 5 in $\mathbb{P}^{5}$ is a projective space of dimension $N=251$. Let $U \subset \mathbb{P}^{N}$ be the open set parameterizing the smooth $X_{v}, U_{0} \subset U$ the open subset corresponding to those $X$ for which $\Omega_{X}$ is a smooth, irreducible surface. Let $\Delta \subset U_{0}$ be a polydisk centered at $0 \in \Delta, X=X_{0}$, and for any $v \in \Delta$, define $j_{v}$ : $\Omega_{X_{1}} \leftrightarrow \amalg_{v \in \Delta^{*}} \Omega_{X_{r}}$ to be the inclusion morphism. Now $\amalg_{v \in \Delta^{\prime}} \Omega_{X_{r}}$ is topologically equivalent to $\Delta \times \Omega_{X_{,}}$(see [7]) for any given $v \in \Delta$, and therefore there is an isomorphism $j_{v}^{*} \circ\left(j_{0}^{*}\right)^{-1}: H^{2}\left(\Omega_{X}, \mathbb{Q}\right) \rightarrow H^{2}\left(\Omega_{X_{i}}, \mathbb{Q}\right)$.
(0.3) Definition:
(i) $H_{A}^{1,1}\left(\Omega_{X}, \mathbb{Q}\right)=\left\{\gamma \in H^{2}\left(\Omega_{X}, \mathbb{Q}\right) \mid j_{v}^{*} \circ\left(j_{0}^{*}\right)^{-1}(\gamma) \in H^{1,1}\left(\Omega_{X}, \mathbb{Q}\right)\right.$ for all $v \in \Delta\}$.
(ii) $H_{P}^{2}\left(\Omega_{X}, \mathbb{Q}\right)=$ orthogonal complement of $H_{A}^{1,1}\left(\Omega_{X}, \mathbb{Q}\right)$ in $H^{2}\left(\Omega_{X}, \mathbb{Q}\right)$.
defined as follows (see (3.1) for a precise definition): (0.5) Let $l_{x}$ be the line corresponding to $x \in \Omega_{x}$. Define $D(x)=\left\{y \in \Omega_{x} \mid y \neq x \& l_{x} \cap l_{y} \neq\right.$ $\varnothing\}$. It is proven (see (2.5)) that for generic $X, D(x)$ is a finite set for generic $x \in \Omega_{X}$.

Our theorem is: ( $X$ generic)
(0.6) Theorem:
(i) $i$ preserves the subspaces defined in (0.3)(i)\&(ii); moreover $i$ : $H_{P}^{2}\left(\Omega_{X}, \mathbb{Q}\right) \rightarrow H_{P}^{2}\left(\Omega_{X}, \mathbb{Q}\right)$ is an isomorphism.
(ii) There is a s.e.s.:

$$
0 \rightarrow(i+119 \cdot I) H_{P}^{2}\left(\Omega_{X}, \mathbb{Q}\right) \xrightarrow{i} H_{P}^{2}\left(\Omega_{X}, \mathbb{Q}\right) \xrightarrow{\Phi_{*}} \operatorname{Prim}^{4}(X, \mathbb{Q}) \rightarrow 0,
$$

where $i$ and I are respectively the inclusion and identity morphisms. (iii) $\Phi_{*}\left(H_{A}^{1,1}\left(\Omega_{X}, \mathbb{Q}\right)\right)=\mathbb{Q} \omega \wedge \omega$.
(0.7) Corollary:

is sign commutative.

Much of the techniques of this paper are borrowed from an interesting paper by Tyurin ([6]).

## §1. Notation

(i) $\mathbb{Z}=$ integers, $\mathbb{Q}=$ rational numbers, $\mathbb{C}=$ complex numbers
(ii) $X$ is a quintic fourfold, $\mathbb{P}^{M}$ is complex, projective $M$-space.
(iii) If $Y$ is a projective, algebraic manifold, then $H^{p, p}(Y)$ is Dolbeault cohomology of type $(p, p)$ and $H^{p, p}(Y, K)=H^{p, p}(Y) \cap$ $H^{2 p}(Y, K)$, where $K=\mathbb{Z}, \mathbb{Q}$.
(iv) Prim stands for primitive cohomology.
(v) There are 2 senses to the word "generic" in this paper. We say that $X$ is generic if it is a member of a family $\left\{X_{v}\right\}_{v \in W}$ satisfying a given property, and where $W \subset \mathbb{P}^{N}$ is a Zariski open subset. The other use of the word "generic" is where $X$ satisfies a given property that is transcendental in nature, and in this case the word generic will be prefixed by "transcendental".
(vi) Let $Y \subset \mathbb{P}^{M}$ be given as in (iii) above, $G=$ Grassmannian of lines in $\mathbb{P}^{M}$. For $x \in G$, let $l_{x}$ be the corresponding line in $\mathbb{P}^{M}$. The variety of lines in $Y$, denoted by $\Omega_{Y}$ is defined as follows: $\Omega_{Y}=\left\{x \in G \mid l_{x} \subset Y\right\}$.
(vii) Given $Y$ as in (iii) and $S \subset Y$ an algebraic subset. Then $\operatorname{dim} S=$ $\max \{\operatorname{dim}$ of irreducible components of $S\}$, and $\operatorname{codim}_{Y} S=\operatorname{dim} Y-$ $\operatorname{dim} S$.

## §2. The variety of lines in $X$

Let $Y \subset \mathbb{P}^{n}$ be a generic hypersurface of degree $d$, and assume $2 n-d-$ $5 \geqslant 0$. An immediate consequence of [1] is:
(2.1) Theorem: $\Omega_{Y}$ is smooth and irreducible, of dimension $2 n-d-3$.

There are two noteworthy cases to consider:
(2.2) Corollary: Given $X$ a generic quintic fourfold, and $Z$ a generic fivefold of degree 5 in $\mathbb{P}^{6}$, then:
(i) $\Omega_{X}$ is a smooth, irreducible surface and
(ii) $\Omega_{Z}$ is a smooth, irreducible fourfold.

An argument identical to one given in [6; p.38] yields:
(2.3) Proposition: Given $Z$ as in (2.2). Then through a generic point of $Z$ passes 5! lines.

Before stating the main result of this section, we introduce the following notation: Let $c \in \Omega_{X}, l_{c} \subset X$ the corresponding line.
(2.4) $\Omega_{X, c}=\left\{y \in \Omega_{X} \mid l_{y} \cap l_{c} \neq \emptyset\right\}$.We prove:
(2.5) Theorem: Let $X$ be generic.
(i) $\operatorname{dim} \Omega_{X, c}=0$ for generic $c \in \Omega_{X}$.
(ii) Let $c \in \Omega_{X}$ be generic. Then for any $y \in l_{c}$, there is at most one line $l_{0} \subset X$ other than $l_{c}$ passing through $y$.

Proof: We start by letting $X$ be any degree 5 hypersurface in $\mathbb{P}^{5}$, and $x \in X$. If we let [ $X_{0}, X_{1}, X_{2}, X_{3}, X_{4}, X_{5}$ ] be the homogeneous coordinates defining $\mathbb{P}^{5}$, then $X$ admits as its defining equation $F=0, F \in$ $\mathbb{C}\left[X_{0}, \ldots, X_{5}\right]$ a homogeneous polynomial of degree 5 . Now after applying a projective transformation, there is no loss of generality in assuming $x=[0,0,0,0,0,1]$. In this case $F$ takes the form: $F=X_{5}^{4} F_{1}+X_{5}^{3} F_{2}+$ $X_{5}^{2} F_{3}+X_{5} F_{4}+F_{5}$, where $F_{i} \in \mathbb{C}\left[X_{0}, \ldots, X_{4}\right]$ is homogeneous of degree $i$. We now convert to affine coordinates by setting $x_{t}=X_{i} / X_{5}, i=0, \ldots, 4$. Define $f_{1}=F_{1} / X_{5}^{\prime}$. and note that $f_{i} \in \mathbb{C}\left[x_{0}, \ldots, x_{4}\right]$ is homogeneous of degree $i$. Likewise, set $f=F / X_{5}^{5}$, and note that $f=f_{1}+f_{2}+f_{3}+f_{4}+f_{5}$. In affine coordinates $x=(0,0,0,0,0)$, therefore any line $l_{a}$ passing through $x$ must be of the form $l_{a}=\{t a \mid t \in \mathbb{C}\}$, where $a \in \mathbb{C}^{5}$ is non-zero.

It follows that

$$
\begin{array}{lll}
l_{a} \subset X & \Leftrightarrow & f_{1}(t a)+\cdots+f_{5}(t a)=0 \\
\text { for all } t \\
\text { i.e. } & \Leftrightarrow & t f_{1}(a)+\cdots+t^{5} f_{5}(a)=0 \\
& \Leftrightarrow & \text { for all } t \\
& \Leftrightarrow f_{1}(a)=\cdots=f_{5}(a)=0 &
\end{array}
$$

The upshot of this argument is that the lines in $X$ passing through $x$ correspond to the zeros of $f_{1}, \ldots, f_{5}$ in $\mathbb{P}^{4}$. Note that for generic $x \in X$, no such line exists. Let $V(i)$ be the vector space of homogeneous polynomials of degree $i$ in $\mathbb{C}\left[x_{0}, \ldots, x_{4}\right]$, and set $V=V(1) \oplus \ldots \oplus V(5)$. It is clear from our construction that $X$ determines a point $v \in \mathbb{P}(V)$, conversely, any $v \in \mathbb{P}(V)$ determines $X$ so that $x \in X$.
(2.6) Every $v \in \mathbb{P}(V)$ determines an algebraic set $S(v)$ defined as the zeros of $f_{1}, \ldots, f_{5}$ in $\mathbb{P}^{4}$. Define $V_{1}=\{v \in \mathbb{P}(V) \mid \operatorname{dim} S(v) \geqslant 0\}$.If $v \in$ $\mathbb{P}(V)$ is given so that $\operatorname{dim} S(v)=0$, then define $\# S(v)$ to be the cardinality of $S(v)$ as a set. For $i=2,3$ define $V_{t}=\left\{v \in V_{1} \mid \operatorname{dim} S(v) \geqslant 1\right.$ or $\# S(v) \geqslant i\}$, and set $V_{B}=\left\{v \in V_{1} \mid \operatorname{dim} S(v) \geqslant 1\right\}$. We need the following:
(2.7) Lemma: $\operatorname{codim}_{\mathbb{P}(V)} V_{1}=i$, for $i=1,2,3 \& \operatorname{codim}_{\mathbb{P}(V)} V_{B} \geqslant 5$.

Proof: Let $V^{\prime}=V(j) \oplus \cdots \oplus V(5) \subset V$, for $j=1, \ldots, 5$, and $\mathbb{P}\left(V^{\prime}\right) \subset$ $\mathbb{P}(V)$ the corresponding projective subspaces. Note that for $v \in \mathbb{P}\left(V^{\prime}\right)$, $S(v)=$ zeros of $\left\{f_{j}, \ldots, f_{5}\right\}$ in $\mathbb{P}^{4}$. We will prove (2.7) case-by-case:
(a) $\operatorname{codim}_{\mathbb{P}(V)} V_{1}=1$ : It follows from general principles ([5; (3.30)]) that $v \in \mathbb{P}\left(V^{2}\right) \Rightarrow S(v) \neq \emptyset$, so for such $v$, choose any $y \in S(v)$. Clearly $\left\{f_{1} \in\right.$ $\left.\mathbb{P}(V(1)) \mid f_{1}(y)=0\right\}$ cuts out a codimension 1 subspace of $\mathbb{P}(V(1))$, hence $\operatorname{codim}_{\mathbb{P}(V)} V_{1}=1$.
(b) $\operatorname{codim}_{\mathbb{P}(V)} V_{2}=2$ : Let $v \in V^{2}$ be given so that $\operatorname{dim} S(v)=0$ and $\# S(v) \geqslant 2$. Let $y_{1}, y_{2} \in S(v)$ with $y_{1} \neq y_{2}$. Then $\left\{f_{1} \in \mathbb{P}(V(1)) \mid f_{1}\left(y_{1}\right)=\right.$ $\left.f_{1}\left(y_{2}\right)=0\right\}$ cuts out a subspace of codimension 2 in $\mathbb{P}(V(1))$. Statement (b) now follows from:
(2.8) Sublemma: $\left\{v \in \mathbb{P}\left(V^{2}\right) \mid \operatorname{dim} S(v) \geqslant 1\right\}$ has codimension $\geqslant 3$ in $\mathbb{P}\left(V^{2}\right)$.

Proof: If $v \in \mathbb{P}\left(V^{3}\right)$, then $\operatorname{dim} S(v) \geqslant 1$ and equal to 1 for generic $v$. Define $H=\left\{(y, v) \in \mathbb{P}^{4} \times \mathbb{P}\left(V^{3}\right) \mid y \in S(v)\right\}$, and let $q_{1}, q_{2}$ be the canonical projections in the diagram below:

Note that the fibers of $q_{1}$ are projective spaces，all of which are projectively equivalent to each other；moreover $q_{1}$（and $q_{2}$ ）are surjective， hence $H$ is irreducible．In addition $q_{2}^{-1}(v)=S(v)$ ，and by our construc－ tion，the generic fiber of $q_{2}$ is a smooth，irreducible curve of degree 60 （Bezout＇s theorem）．Let $K=\left\{v \in \mathbb{P}\left(V^{3}\right) \mid \operatorname{dim} S(v) \geqslant 2\right\}$ ．Then by con－ sidering the morphism $q_{2}$ ，it follows that $\operatorname{codim}_{\left.P_{( } V^{3}\right)} K \geqslant 2$ ，（in fact $\left.\operatorname{codim}_{\mathbb{P}\left(V^{2}\right)} K \geqslant 3\right)$ ．If $v \in \mathbb{P}\left(V^{3}\right)$ is given so that $\operatorname{dim} S(v)=1$ ，then elementary reasoning implies $\left\{f_{2} \in \mathbb{P}(V(2)) \mid f_{2}\right.$ vanishes on a component of $S(v)$ of dimension 1$\}$ is of codimension $\geqslant 3$ in $\mathbb{P}(V(2))$ ．On the other hand if $v \in \mathbb{P}\left(V^{3}\right)$ is given so that $\operatorname{dim} S(v) \geqslant 2$ ，then one constructs a diagram analogous to（2．9），replacing $\mathbb{P}\left(V^{3}\right)$ by $\mathbb{P}\left(V^{4}\right)$ ，modifying $H$ accordingly，and applying a similar reasoning as above to conclude $\operatorname{codim}_{\mathbb{P}\left(V^{2}\right)} K \geqslant 3$ ，hence（2．8）．
（c） $\operatorname{codim}_{\mathbb{P}(V)} V_{3}=3$ ：If $v \in V^{2}$ is generically chosen，then $\# S(v)=5$ ！ （bezout＇s theorem），moreover no 3 points in $S(v)$ are collinear．If $y_{1}, y_{2}$ ， $y_{3} \in S(v)$ are distinct，then $\left\{f_{1} \in \mathbb{P}(V(1)) \mid f_{1}\left(y_{1}\right)=f_{1}\left(y_{2}\right)=f_{1}\left(y_{3}\right)=0\right\}$ is a subspace of codimension 3in $\mathbb{P}(V(1))$ ．The case that $v \in V^{2}$ is given so that $\operatorname{dim} S(v) \geqslant 1$ is taken care of by（2．8）．There remains the possibility that $v \in V^{2}$ is given so that $\operatorname{dim} S(v)=0$ and that some collinearity（of 3 points）exists．For this to happen，$v$ would have to belong to a proper subvariety，of $V^{2}$ ，and one can easily argue that statement（c）still holds．
（d） $\operatorname{codim}_{\mathbb{P}(V)} V_{B} \geqslant 5$ ：A construction similar to the proof of（2．8）implies $\left\{v \in \mathbb{P}\left(V^{2}\right) \mid \operatorname{dim} S(v) \geqslant 2\right\}$ is of codimension $\geqslant 5$ in $\mathbb{P}\left(V^{2}\right)$ ．Now sup－ pose $v \in \mathbb{P}\left(V^{2}\right)$ is given so that $\operatorname{dim} S(v)=1$ ．Then $\left\{f_{1} \in \mathbb{P}(V(1)) \mid f_{1}\right.$ vanishes on a dimension 1 component of $S(v)\}$ is of codimension $\geqslant 2$ in $\mathbb{P}(V(1))$ ．We now apply（2．8）to conclude statement（d），and the proof of （2．7）．

## （2．10）Conclusion of the proof of（2．5）

Recall at the beginning of the proof a choice of $x \in \mathbb{P}^{5}$ which determines $\mathbb{P}(V), V_{1}, V_{2}, V_{3}, V_{B}$ ，where $\mathbb{P}(V)$ corresponds to those $X \subset \mathbb{P}^{5}$ for which $x \in X$ ．To indicate that our choice of $x$ determines $\mathbb{P}(V)$ ，we will relabel things with the obvious meaning as $\mathbb{P}\left(V_{v}\right), V_{1, \mathrm{r}}, V_{2, \mathrm{v}}, V_{3, \mathrm{v}}, V_{B, 1}$ ． Now define $W=山_{x \in \mathbb{P}^{s}} \mathbb{P}\left(V_{x}\right), W_{t}=山_{x \in \mathbb{P}^{\wedge}} V_{t, x}$ for $i=1,2,3, W_{B}=$ $\amalg_{x \in \mathbb{P}^{s}} V_{B, x}$ ．It is easy to verify that $W, W_{\prime}$＇s，$W_{B}$ all have the structure of an algebraic variety，moreover by（2．7）：
（2．11） $\operatorname{codim}_{W} W_{l}=i$ for $i=1,2,3$ and $\operatorname{codim}_{W} W_{B} \geqslant 5$.
Recall the statement just preceeding（2．6），that for any $X$ and $x \in X, X$ determines a point $v_{x} \in \mathbb{P}\left(V_{x}\right)$ ．Therefore $X$ determines a fourfold $X_{W} \subset$ $W$ given by the formula $X_{W}=山_{x \in X} v_{x}$ ．For generic $X \subset \mathbb{P}^{5}, \operatorname{dim}\left\{X_{W} \cap\right.$ $\left.W_{1}\right\}=4-i$ ，and $X_{W} \cap W_{B}=\varnothing$ ．Translating this in terms of $\Omega_{X}$ ，（2．5） clearly holds．

## §3. The incidence and cylinder homomorphisms

Let $D_{1} \subset \Omega_{X} \times \Omega_{X}$ be given by the formula: $D_{1}=\left\{\left(x_{1}, x_{2}\right) \in \Omega_{X} \times\right.$ $\left.\Omega_{X} \mid l_{x_{1}} \cap l_{x_{2}} \neq \emptyset \& x_{1} \neq x_{2}\right\}$. It is clear from the definition that $\left\{x, D_{1}(x)\right\}=\Omega_{X, x}$. Throughout this section $X$ will be assumed to be generic.
(3.1) Definition: The incidence correspondance $D \subset \Omega_{X} \times \Omega_{X}$ is defined to be: $D=\bar{D}_{1}$.

Note that $\operatorname{codim}_{\Omega_{\lambda} \times \Omega_{1}} D=2$, therefore the fundamental class of $D$ defines a cocycle $[D] \in H^{4}\left(\Omega_{x} \times \Omega_{x}, \mathbb{Q}\right)$. Now the component of $[D]$ in $H^{2}\left(\Omega_{X}, \mathbb{Q}\right) \otimes H^{2}\left(\Omega_{X}, \mathbb{Q}\right)$, via the Künneth formula $H^{4}\left(\Omega_{x} \times \Omega_{X}, \mathbb{Q}\right)=$ $\oplus_{p+q=4} H^{p}\left(\Omega_{X}, \mathbb{Q}\right) \otimes H^{q}\left(\Omega_{X}, \mathbb{Q}\right)$, induces a morphism $i: H^{2}\left(\Omega_{X}, \mathbb{Q}\right) \rightarrow$ $H^{2}\left(\Omega_{X}, \mathbb{Q}\right)$, where we use the fact $H^{2}\left(\Omega_{x}, \mathbb{Q}\right)^{*} \cong H^{2}\left(\Omega_{x}, \mathbb{Q}\right)$ (Poincaré duality).
(3.2) Definition: The homomorphism $i: H^{2}\left(\Omega_{X}, \mathbb{Q}\right) \rightarrow H^{2}\left(\Omega_{X}, \mathbb{Q}\right)$ is called the incidence homomorphism.

The morphism $i$ factors into a composite of 3 other morphisms given as follows:
(3.3) Let
(i) $p: D \rightarrow \Omega_{X}$ be the projection onto the first factor,
(ii) $j: \Omega_{X} \times \Omega_{X} \rightarrow \Omega_{X} \times \Omega_{X}$ the morphism which permutes the factors, i.e. $j\left(x_{1}, x_{2}\right)=\left(x_{2}, x_{1}\right)$. Note that $j(D)=D$.

Then:
(3.4) Proposition: $i=p_{*} \circ j \circ p^{*}$.

Proof: Use the fact that the correspondence defined by $p_{*} \circ j \circ p^{*}$ in $\Omega_{X} \times \Omega_{X}$ is precisely $D$.

## (3.5) The cylinder homomorphism

We will be constantly referring to the following diagram:

where, $Z$ is a smooth degree 5 hypersurface in $\mathbb{P}^{6}$, for which $X \subset Z$ is a (smooth) hyperplane section

$$
\begin{aligned}
& P(X)=\left\{(c, x) \in \Omega_{X} \times X \mid x \in l_{c}\right\} \\
& P(Z)=\left\{(c, z) \in \Omega_{Z} \times Z \mid z \in l_{c}\right\}
\end{aligned}
$$

$\rho$ (resp. $\rho_{Z}$ ) is the projection of $P(X)$ (resp. $P(Z)$ ) onto the first factor
$\varphi\left(\operatorname{resp} . \varphi_{Z}\right)$ is the projection of $P(X)($ resp. $P(Z))$ onto the second factor

$$
\tilde{X}=\varphi_{Z}^{-1}(X), \varphi_{X}=\varphi_{\left.Z\right|_{i}}: \tilde{X} \rightarrow X, \rho_{X}=\rho_{\left.Z\right|_{i}}: \tilde{X} \rightarrow \Omega_{Z}
$$

$i_{1}, i_{2}, i_{3}, j_{1}, j_{2}$ are inclusion morphisms.
The same reasoning given in [2; p. 81] implies the following:
(3.7) Proposition (see [4]):
(i) $P(X), P(Z)$ are $\mathbb{P}^{1}$ bundles over $\Omega_{X}$ and $\Omega_{Z}$ respectively.
(ii) $P(X), P(Z), \tilde{X}, \Omega_{X}, \Omega_{Z}$ are smooth and irreducible.
(iii) All morphisms in (3.6), except for inclusions, are surjective.
(iv) $\operatorname{deg} \varphi_{Z}=\operatorname{deg} \varphi_{X}=5$ !.
(v) $\rho_{X}$ is birational and induces: $\tilde{X} \cong$ blow up of $\Omega_{Z}$ along $\Omega_{X}$.
(3.8) Remarks:
(i) (2.2 implies the smoothness and irreducibility for $\Omega_{X}$ and $\Omega_{z}$.
(ii) (3.7) (iv) is a consequence of (2.3).

As will be discussed in $\S 4$, the threefold $\varphi(P(X))$ has a 2-dimensional singular set. Let $S$ be a generic hyperplane section of $\varphi(P(X)$ ). One should expect $S$ to be singular. The next result is a direct consequence of (2.5), together with the definitions of $P(X), \rho, \varphi$ :
(3.9) Proposition: $\varphi$ is a birational morphism, moreover $\varphi$ induces $a$ birational map $\Omega_{X} \approx S$.
(3.10) Definition: The cylinder homomorphism $\Phi_{*}: H^{2}\left(\Omega_{X}, \mathbb{Q}\right) \rightarrow$ $H^{4}(X, \mathbb{Q})$ is given by: $\Phi_{*}=j_{1, *} \circ \varphi_{*} \circ \rho^{*}$.

Let $I: H^{2}\left(\Omega_{X}, \mathbb{Q}\right) \rightarrow H^{2}\left(\Omega_{X}, \mathbb{Q}\right)$ be the identity morphism, $\omega \in$ $H^{1,1}(X, \mathbb{Z})$ the Kähler class defined in (0.1). The next result ties in a relationship between $i$ and $\Phi_{*}$.
(3.11) Proposition: $\Phi_{*}\left(\left\{(i+119 \cdot I) H^{2}\left(\Omega_{X}, \mathbb{Q}\right)\right\}\right)=0$ in $H^{4}(X, \mathbb{Q}) /$ $\mathbb{Q} \omega \wedge \omega$

Proof: The proof of (3.11) is formally identical to the proof of lemma 6 in [6; p. 42] where
(a) Z and $\operatorname{deg} \varphi_{\mathrm{Z}}=5$ ! replace $X_{4}$ and $\operatorname{deg} \varphi$ in [6].
(b) the cycles are even dimensional.
(c) the weak Lefschetz theorem applied to the inclusions $Z \subset \mathbb{P}^{6} \& j_{2}$ : $X \hookrightarrow Z$ implies $j_{2}^{*}\left(H^{4}(Z, \mathbb{Q})\right)=\mathbb{Q} \omega \wedge \omega$.
(d) $119=5!-1$.

## $\S 4$. The numerical characteristic of the surface $\Omega_{X}$

Let $\psi_{1}: D_{1} \rightarrow X$ be the morphism defined by the formula: $\psi_{1}\left(x_{1}, x_{2}\right)=$ $l_{x_{1}} \cap l_{x_{2}} \in X$. Then $\psi_{1}$ extends to a rational map $\psi_{0}: D \rightarrow X$, moreover $\operatorname{deg} \psi_{0}=2$ by (2.5)(ii). Let $\Gamma=D /\{j\}$ with quotient morphism $\psi$ : $D \rightarrow \Gamma$. There is a factorization of $\psi_{0}$ :

where k is a birational map onto its image, $\psi_{0}(\mathrm{D})$. This factorization will be useful in the next section where we consider an analogue to the fundamental computational lemma in [6; p. 45]. Note that the fibers of $\varphi$ in (3.6) are a discrete over every point in $\varphi(P(X))$, moreover $\# \varphi^{-1}(x) \geqslant 2$ over $\overline{\psi_{1}\left(D_{1}\right)}$ and $\# \varphi^{-1}(x)=1$ over $\varphi(P(X))-\overline{\psi_{1}\left(D_{1}\right)}$, where $\#$ includes multiplicity. By applying Zariski's Main theorem to $\varphi$, it is clear that $\operatorname{sing}(\varphi(P(X)))=\overline{\psi_{1}\left(D_{1}\right)}$. On the other hand, $\overline{\psi_{1}\left(D_{1}\right)}=\psi_{0}(D)$, therefore, taking into account the result (2.5)(ii), we can summarize the above discussion in:
(4.2) Proposition: $\operatorname{sing}(\varphi(P(X)))=\psi_{0}(D)$, moreover through a generic point of $\operatorname{sing}(\varphi(P(X)))$ passes exactly 2 lines in $X$.

So far we have only focused on the number of lines passing through a given point in $\varphi(P(X))$. We now turn our attention to the problem of determining the number of lines meeting a generic line in $X$. This number will be denoted by $N_{0}$, and bears the title of this section, namely, recall the definition of $p$ in (3.3)(i):
(4.3) Definition: The numerical characteristic $N_{0}$ of $\Omega_{X}$ is given by: $N_{0}=\operatorname{deg} p$.
(4.4) Remark: This definition is borrowed in part from [6; p. 40].

There is another ingredient we want to introduce, but before doing so, we recall from the Lefschetz theorem applied to $X \subset \mathbb{P}^{5}$ that $H^{2}(X, \mathbb{Z})$ $=\mathbb{Z} \omega$. Let $[\varphi(P(X))]$ be the fundamental class of $\varphi(P(X))$ in $H^{2}(X, \mathbb{Z})$. Then there is a positive integer $d$ for which $[\varphi(P(X))]=d \omega$. Geometri-
cally, $d$ is the degree of the hypersurface in $\mathbb{P}^{5}$ cutting out $\varphi(P(X))$ in $X$. A partial generalization of Fano's work (see [6; p. 40]) implies $d$ and $N_{0}$ are related by the simple:
(4.5) Proposition: $d-N_{0} \leqslant-2$.

Proof: The proof is essentially borrowed from lemma 5 in [6; p. 40], but there are important differences accounting for the changes in statements between (4.5) and [6]. Let $l=\mathbb{P}^{1}, \mathbb{P}^{3}, X$ be generically chosen in $\mathbb{P}^{5}$, so that $l \subset X \cap \mathbb{P}^{3}$, and that $S_{0}=\mathbb{P}^{3} \cap X$ is a smooth quintic surface. The adjunction formula for $S_{0} \subset \mathbb{P}^{3}$ implies $\Omega_{S_{0}}^{2}=\mathcal{O}_{S_{0}}(1)$, where $\Omega_{S_{0}}^{2}$ is the canonical sheaf of $S_{0}$. Note that $l$ is the only line in $S_{0}$, since a generic hyperplane section of $X$ contains only a finite number of lines ([1]), and $S_{0}$ is cut out by a generic $\mathbb{P}^{3}$. If $H$ is a generic hyperplane in $\mathbb{P}^{5}$ containing $l$, then $H \cap S_{0}=l+C_{0}$, where $C_{0}$ is a smooth and irreducible curve. Note from the above expression for $\Omega_{S_{0}}^{2}$ that $\Omega_{S_{0}}^{2}=\mathcal{O}_{S_{0}}\left(H \cap S_{0}\right)=$ $\mathcal{O}_{S_{0}}\left(l+C_{0}\right)$. Now taking intersections: $1=(l \cdot H)_{\mathbb{P}^{5}}=\left(l \cdot\left(H \cdot S_{0}\right)\right)_{S_{0}}=(l$ $\left.\cdot\left(l+C_{0}\right)\right)_{S_{0}},($ where $\cdot=\cap)$, consequently $\left(l \cdot C_{0}\right)_{S_{0}}=1-l^{2}$. On the other hand, the adjunction formula applied to $l \subset S_{0}$ implies: $-2=(l \cdot(l+(H$ - $\left.\left.S_{0}\right)\right)_{S_{0}}=l^{2}+1$, hence $l^{2}=-3$, afortiori $\left(l \cdot C_{0}\right)_{S_{0}}=4$. Next $S_{0} \cap$ $\varphi(P(X))=l+C_{1} \sim d\left(H \cdot S_{0}\right)=d l+d C_{0}$, hence $C_{1} \sim(d-1) l+d C_{0}$, therefore $\left(C_{1} \cdot l\right)_{S_{0}}=(d-1) l^{2}+d\left(l \cdot C_{0}\right)_{S_{0}}=d+3$. Now $\varphi^{-1}(\varphi(P(X))$ $\left.\cap S_{0}\right)=l+\varphi^{-1}\left(C_{1}\right)$ where $\varphi^{-1}\left(C_{1}\right)$ is no longer regarded as a global section of the fibering $p: P(X) \rightarrow \Omega_{X}$ as in [6], but rather as a section of $\rho$ over a curve in $\Omega_{X}$, where we use the aforementioned fact that $l$ is the only line in $S$. Then among the points of intersection in $C_{1} \cdot l$ is a possible point of intersection of $l$ with $\varphi^{-1}\left(C_{1}\right)$, and the remaining points are the intersections of $l$ with at most the other lines in $X$ meeting $l$. Therefore $\left(C_{1} \cdot l\right)_{S_{0}} \leqslant N_{0}+1$, afortiori $d+3 \leqslant N_{0}+1$, which proves (4.5).

Let $H_{1}$ be the hypersurface of degree $d$ which cuts out $\varphi(P(X)) \subset X$, and let $l \subset X$ be any line. Since $l \subset X$, we have $\left(H_{1} \circ l\right)_{\mathbb{P}^{s}}=\left(\left(H_{1} \cdot X\right) \cdot l\right)_{X}$. Furthermore $d=\left(H_{1} \cdot l\right)_{\mathbb{P}^{s}}$, moreover $H_{1} \cap X=\varphi(P(X))$. In summary:
(4.6) Proposition: $d=(\varphi(P(X)) \circ l)_{X}$.

This concludes §4.

## §5. The fundamental computational lemma (F.C.L.)

In this section we will arrive at a version of the F.C.L. in [6] for $\Phi_{*}$ : $H_{2}\left(\Omega_{X}, \mathbb{Q}\right) \rightarrow H_{4}(X, \mathbb{Q})$ where $\Phi_{*}$ is studied on the homology level via Poincaré duality. As in $\S 4, X$ will be a generic quintic. Now recalling the
diagram in (4.1) together with (4.2), there is a diagram:

Define $\Gamma_{0}=\{y \in \Gamma \mid k$ is regular at $y \& k(y) \notin \operatorname{sing}(\operatorname{sing} \varphi(P(X)))\}$. Clearly $\Gamma_{0}$ is smooth and Zariski open in $\Gamma$. Next define $D_{0}=\psi^{-1}\left(\Gamma_{0}\right)$, $\Sigma_{0}=D-D_{0}$, and note that $j\left(D_{0}\right)=D_{0}$ and $\Sigma_{0}$ is closed in $D$. Note that $\Sigma=p\left(\Sigma_{0}\right) \subset \Omega_{X}$ is closed and of codimension $\geqslant 1$. Define $\Omega_{X, 0}=\Omega_{X}-\Sigma$. We can desingularize the diagram in (5.1) to:

where all maps are morphisms, and $\tilde{D}, \tilde{\Gamma}$ are smooth. Diagrams (5.1) \& (5.2) are analogous to the diagrams on $p .46 \& 47$ in [6], indeed we have even tried to retain similar notation. Let $i_{0}: \Omega_{X, 0} \rightarrow \Omega_{X}$ be the inclusion, and set $H_{2}\left(\Omega_{X}, \mathbb{Q}\right)_{\Sigma}=i_{0, *}\left(H_{2}\left(\Omega_{X, 0}, \mathbb{Q}\right)\right) \subset H_{2}\left(\Omega_{X}, \mathbb{Q}\right)$. We can now state:
(5.3) Theorem (F.C.L.): Let $\gamma_{1}, \gamma_{2} \in H_{2}\left(\Omega_{X}, \mathbb{Q}\right)_{\Sigma}$. Then $\left(\Phi_{*}\left(\gamma_{1}\right)\right.$. $\left.\Phi_{*}\left(\gamma_{2}\right)\right)_{X}=\left(d-N_{0}\right)\left(\gamma_{1} \cdot \gamma_{2}\right)_{\Omega_{X}}+\left(i \gamma_{1} \cdot \gamma_{2}\right)_{\Omega_{X}}$.

Proof: Except for dimensions of cycles in question, the proof of (5.3) is formally identical to the proof of the F.C.L. in [6; p. 45], which begins on p. 46 of [6], and involves the integral invariants $N_{0}$, and $d$ of (4.6).
(5.4) For the remainder of this section, we will occupy ourselves with the problem of reformulating (5.3) so as to not involve the particular algebraic cycle $\Sigma \subset \Omega_{X}$.

We will now fulfill a promise made earlier:
(5.5) Proposition: $\Phi_{*}: H^{2}\left(\Omega_{X}, \mathbb{Q}\right) \rightarrow H^{4}(X, \mathbb{Q})$ is surjective.

Proof: We will use the notation following (0.2) where $\Delta \subset U_{0}$ is a polydisk centered at $0 \in \Delta, X=X_{0} \in \amalg_{v \in \Delta} X_{v}$. Let $i_{v}: X_{v} \hookrightarrow \bigsqcup_{v \in \Delta} X_{v}$ be the inclusion morphism. Let $X$ be transcendentally generic. Now because $\Delta$ is uncountable, any $\gamma \in H^{2,2}(X, \mathbb{Q})$ will have a horizontal displace-
ment in $\amalg_{v \in \Delta} H^{4}\left(X_{v}, \mathbb{Q}\right)$ which is also of Hodge type (2,2), i.e. $i_{r}^{*} \circ\left(i_{0}^{*}\right)^{-1}(\gamma) \in H^{2,2}\left(X_{v}, \mathbb{Q}\right)$ for all $v \in \Delta$. However it is a general fact (using Lefschetz pencils) that such $\gamma \in \mathbb{Q} \omega \wedge \omega$, hence $X$ transcendentally generic $\Rightarrow H^{2,2}(X, \mathbb{Q})=\mathbb{Q} \omega \wedge \omega$. This means that the only algebraic cocycle in $H^{4}(X, \mathbb{Q})$ is a $\mathbb{Q}$ multiple of $\omega \wedge \omega$. Since $\Phi_{*}$ preserves algebraicity, clearly $\Phi_{*}$ is surjective for transcendental $X$. Now it can be easily seen that the cylinder homomorphisms $\Phi_{v, *}: H^{2}\left(\Omega_{X}, \mathbb{C}\right) \rightarrow$ $H^{4}\left(X_{v}, \mathbb{C}\right)$ piece together to form a morphism $\bar{\Phi}: \amalg_{v \in \Delta} H^{2}\left(\Omega_{X_{v}}, \mathbb{C}\right) \rightarrow$ $\amalg_{v \in \Delta} H^{4}\left(X_{v}, \mathbb{C}\right)$ of (trivial) analytic vector bundles over $\Delta$. From the above discussion $\bar{\Phi}$ is fiberwise surjective on a uncountable dense subset of $\Delta$, hence by analytic considerations, must be surjective over $\Delta$. Q.E.D.

Let $k_{0}: \Sigma \hookrightarrow \Omega_{X}$ be the inclusion. Our next result is:

## Proposition:

$$
H_{2}\left(\Omega_{X}, \mathbb{Q}\right)_{\Sigma}=\left\{\begin{array}{c}
\gamma \in H_{2}\left(\Omega_{X}, \mathbb{Q}\right) \mid\left(\gamma \cdot k_{0, *}(\alpha)\right)_{\Omega_{X}}=0  \tag{5.6}\\
\text { for all } \alpha \in H_{2}(\Sigma, \mathbb{Q})
\end{array}\right\} .
$$

Proof: It follows from [3; ch. 27] that there is a commutative diagram: (for our purposes $H^{2}\left(\Omega_{X}, \mathbb{C}\right)$ will be viewed as deRham cohomology)

$$
\begin{gather*}
H^{2}\left(\Omega_{X}, \mathbb{Q}\right) \xrightarrow{k_{0}^{*}} H^{2}(\Sigma, \mathbb{Q})  \tag{5.7}\\
H_{2}\left(\Omega_{X, 0}, \mathbb{Q}\right) \xrightarrow{D_{P} \uparrow{ }^{i_{0,} *}} H_{2}\left(\Omega_{X}, \mathbb{Q}\right) \xrightarrow{f_{*}} H_{2}\left(\Omega_{X}, \Omega_{X, 0}\right)
\end{gather*}
$$

where $D_{P}$ and $D_{A}$ are respectively Poincaré and Alexander duality. Now for

$$
\begin{aligned}
& \gamma \in H_{2}\left(\Omega_{X}, \mathbb{Q}\right), f_{*}(\gamma) \\
&=0 \Leftrightarrow k_{0}^{*} \circ D_{P}(\gamma)=0 \\
& \Leftrightarrow \int_{k_{0 . *}(\alpha)} D_{P}(\gamma)=0 \quad \text { for all } \alpha \in H_{2}(\Sigma, \mathbb{Q}) \\
& \Leftrightarrow\left(\gamma \cdot k_{0, *}(\alpha)\right)_{\Omega_{x}}=0 \quad \text { for all } \alpha \in H_{2}(\Sigma, \mathbb{Q}) .
\end{aligned}
$$

Now recall the Lefschetz $(1,1)$ theorem which states that $H^{1,1}\left(\Omega_{X}, \mathbb{Z}\right)$ is generated by the fundamental classes of algebraic curves in $\Omega_{X}$. We introduce the following notation:
(5.8) Definition:
(i) The transcendental cohomology, $H_{T}^{2}\left(\Omega_{X}, \mathbb{Q}\right)$, is given by: $H_{T}^{2}\left(\Omega_{X}, \mathbb{Q}\right)=\left\{\gamma \in H^{2}\left(\Omega_{X}, \mathbb{Q}\right) \mid \gamma \wedge H^{1,1}\left(\Omega_{X}, \mathbb{Q}\right)=0\right\}$.
(ii) $H_{\Sigma}^{2}\left(\Omega_{X}, \mathbb{Q}\right)=D_{P}\left(H_{2}\left(\Omega_{X}, \mathbb{Q}\right)_{\Sigma}\right)$.
(5.9) Corollary: $H_{T}^{2}\left(\Omega_{X}, \mathbb{Q}\right) \subset H_{\Sigma}^{2}\left(\Omega_{X}, \mathbb{Q}\right)$.

Proof: Compare (5.6) to (5.8)(i).
According to (5.9), it is clear that one can formulate a version of (5.3) for cocycles in $H_{T}^{2}\left(\Omega_{X}, \mathbb{Q}\right)$, however there is another subspace in $H_{\Sigma}^{2}\left(\Omega_{X}, \mathbb{Q}\right)$ which contains $H_{T}^{2}\left(\Omega_{X}, \mathbb{Q}\right)$ and best suits our purposes. Recall the definition of $H_{A}^{1.1}\left(\Omega_{X}, \mathbb{Q}\right)$ in (0.3). There is an equivalent definition of $H_{A}^{1,1}\left(\Omega_{X}, \mathbb{Q}\right)$ using the notation in the proof of (5.5) and the Lefschetz $(1,1)$ Theorem.
(5.10) Definition:
(i) $H_{A}^{1,1}\left(\Omega_{X}, \mathbb{Q}\right)=\left\{\begin{array}{l|l}\text { algebraic cocycles } & \begin{array}{l}\text { a horizontal } \\ \gamma \in H^{2}\left(\Omega_{X}, \mathbb{Q}\right) \\ \text { deformation of } \gamma \text { in } \\ \coprod_{v \in \Delta} H^{2}\left(\Omega_{X_{V}}, \mathbb{Q}\right) \text { is } \\ \text { algebraic }\end{array}\end{array}\right\}$.
(ii) $H_{P}^{2}\left(\Omega_{X}, \mathbb{Q}\right)=\left\{\gamma \in H^{2}\left(\Omega_{X}, \mathbb{Q}\right) \mid \gamma \wedge H_{A}^{1,1}\left(\Omega_{X}, \mathbb{Q}\right)=0\right\}$.
(5.11) Remarks: From the general theory of Hilbert schemes, $H_{A}^{1,1}\left(\Omega_{X}, \mathbb{Q}\right)$ is independent of the choice of polydisk $\Delta \subset U_{0}$, $\operatorname{dim} H_{A}^{1,1}\left(\Omega_{X}, \mathbb{Q}\right)$ is constant over $v \in U_{0}$, and $H_{A}^{1,1}\left(\Omega_{X}, \mathbb{Q}\right)=$ $H^{1,1}\left(\Omega_{X}, \mathbb{Q}\right)$ for transcendentally generic $X$.
(5.12) Proposition: $H_{T}^{2}\left(\Omega_{X}, \mathbb{Q}\right) \subset H_{P}^{2}\left(\Omega_{X}, \mathbb{Q}\right) \subset H_{\Sigma}^{2}\left(\Omega_{X}, \mathbb{Q}\right)$.

Proof: The inclusion $H_{T}^{2}\left(\Omega_{X}, \mathbb{Q}\right) \subset H_{P}^{2}\left(\Omega_{X}, \mathbb{Q}\right)$ is obvious from the definitions, moreover is an equality for transcendentally generic $X$ ((5.11)). Next as $X$ varies, i.e. $v \in U_{0}$ varies, $\Sigma$ also varies algebraically, hence $[\Sigma] \in H_{A}^{1,1}\left(\Omega_{X}, \mathbb{Q}\right)$, therefore the second inclusion follows from (5.6), (5.8)(ii)\&(5.10)(ii).

## (5.13) Remarks:

(i) The well known properties of the pairing $H^{2}\left(\Omega_{X}, \mathbb{C}\right) \times H^{2}\left(\Omega_{X}, \mathbb{C}\right)$ $\rightarrow \mathbb{C}$ imply $H^{2}\left(\Omega_{X}, \mathbb{Q}\right)=H_{P}^{2}\left(\Omega_{X}, \mathbb{Q}\right) \oplus H_{A}^{1,1}\left(\Omega_{X}, \mathbb{Q}\right)$ is an orthogonal decomposition under $\wedge$.
(ii) As $X$ varies, i.e. $v \in U_{0}$ varies, the incidence correspondence $D \subset \Omega_{X} \times \Omega_{X}$ also varies algebraically. Therefore $i\left(H_{A}^{1,1}\left(\Omega_{X}, \mathbb{Q}\right)\right) \subset$ $H_{A}^{1,1}\left(\Omega_{X}, \mathbb{Q}\right)$.

We need the following:

$$
\begin{equation*}
\text { Lemma: } \Phi_{*}\left(H_{P}^{2}\left(\Omega_{X}, \mathbb{Q}\right)\right) \subset \operatorname{Prim}^{4}(X, \mathbb{Q}) \tag{5.14}
\end{equation*}
$$

Proof: Let $H_{1}, H_{2}$ be generic hyperplanes in $\mathbb{P}^{5}, X_{s}=H_{1} \cap H_{2} \cap X$, $Y_{s}=X_{s} \cap \varphi(P(X))$. Note that $\left[X_{s}\right]=\omega \wedge \omega \in H^{2,2}(X, \mathbb{Z})$, and $Y_{s}$ is a curve in $S=H_{1} \cap \varphi(P(X))$. By (3.9), $Y_{s}$ induces a corresponding curve $C_{1}$ in $\Omega_{X}$, given by the formula $C_{1}=\rho_{*} \circ \varphi^{*}\left(Y_{s}\right)$. Since $Y_{s}$ varies algebraically as $X$ varies, clearly $\left[C_{1}\right] \in H_{A}^{1,1}\left(\Omega_{X}, \mathbb{Q}\right)$. Now let $\gamma \in H_{2}\left(\Omega_{X}, \mathbb{Q}\right)$ be given so that $D_{P}(\gamma) \in H_{P}^{2}\left(\Omega_{X}, \mathbb{Q}\right)$. From the techniques of the proof of (5.6), it is clear that $\gamma$ can be chosen to be supported on $\Omega_{X}-\operatorname{supp}\left(C_{1}\right)$. Therefore, on the cycle level, $\Phi_{*}(\gamma) \cap Y_{s}=0$, hence $\left(\Phi_{*}(\gamma) \cdot X_{s}\right)_{X}=0$. By translating this in terms of cohomology, $\Phi_{*}\left(H_{P}^{2}\left(\Omega_{X}, \mathbb{Q}\right)\right) \wedge \omega \wedge \omega=0$. But $\wedge \omega: H^{6}(X, \mathbb{Q}) \rightarrow H^{8}(X, \mathbb{Q})$ is an isomorphism, hence $\Phi_{*}\left(H_{P}^{2}\left(\Omega_{X}, \mathbb{Q}\right)\right) \wedge \omega=0$, i.e. $\Phi_{*}\left(H_{P}^{2}\left(\Omega_{X}, \mathbb{Q}\right)\right) \subset \operatorname{Prim}^{4}(X, \mathbb{Q})$. Q.E.D.

There is another needed result:
Lemma: Let $\gamma_{1}, \gamma_{2} \in H_{2}\left(\Omega_{X}, \mathbb{Q}\right)$. Then $\left(i \gamma_{1} \cdot \gamma_{2}\right)_{\Omega_{x}}=\left(\gamma_{1} \cdot i \gamma_{2}\right)_{\Omega_{x}}$.
Proof: Using the notation of (5.2), together with the definition of $j$, there is a commutative diagram:

where $\tilde{j}$ is biregular, and $g$ is a birational morphism. Define $\tilde{p}=p \circ g$ : $\tilde{D} \rightarrow \Omega_{X}$. It is easy to verify that the correspondence defined by $\tilde{p}_{*} \circ \tilde{j}_{*} \circ \tilde{p}^{*}$ is the same as $p_{*} \circ j \circ p^{*}=D$, hence $\tilde{p}_{*} \circ \tilde{j}_{*} \circ \tilde{p}^{*}=i$. Now by applying the projection formula 3 times we have: (Note $\tilde{j}^{*}=\tilde{j}_{*}$ )

$$
\begin{aligned}
\left(i \gamma_{1} \cdot \gamma_{2}\right)_{\Omega_{X}} & =\left(\tilde{p}_{*} \circ \tilde{j}_{*} \circ \tilde{p}^{*}\left(\gamma_{1}\right) \cdot \gamma_{2}\right)_{\Omega_{X}} \\
& =\left(\gamma_{1} \cdot \tilde{p}_{*} \circ \tilde{j}_{*} \circ \tilde{p}^{*}\left(\gamma_{2}\right)\right)_{\Omega_{X}} \\
& =\left(\gamma_{1} \cdot i \gamma_{2}\right)_{\Omega_{X}} .
\end{aligned}
$$

(5.17) Corollary: $i\left(H_{P}^{2}\left(\Omega_{X}, \mathbb{Q}\right)\right) \subset H_{P}^{2}\left(\Omega_{X}, \mathbb{Q}\right)$.

Proof: Otherwise there exists $\gamma_{1} \in H_{P}^{2}\left(\Omega_{X}, \mathbb{Q}\right), \gamma_{2} \in H_{A}^{1,1}\left(\Omega_{X}, \mathbb{Q}\right)$ such that $i\left(\gamma_{1}\right) \wedge \gamma_{2} \neq 0$. But $i\left(\gamma_{1}\right) \wedge \gamma_{2}=\gamma_{1} \wedge i\left(\gamma_{2}\right)$ by (5.15) $=0$ by (5.13), a contradiction.

We can formulate (5.3) for $H_{P}^{2}\left(\Omega_{X}, \mathbb{Q}\right)$ :
(5.18) Proposition: Given $\gamma_{1}, \gamma_{2} \in H_{2}\left(\Omega_{X}, \mathbb{Q}\right)$ with $D_{P}\left(\gamma_{1}\right), D_{P}\left(\gamma_{2}\right)$ in $H_{P}^{2}\left(\Omega_{X}, \mathbb{Q}\right)$. Then $\left(\Phi_{*}\left(\gamma_{1}\right) \cdot \Phi_{*}\left(\gamma_{2}\right)\right)_{X}=\left(d-N_{0}\right)\left(\gamma_{1} \cdot \gamma_{2}\right)_{\Omega_{\mathrm{⿺}}}+\left(i \gamma_{1} \cdot \gamma_{2}\right)_{\Omega_{4}}$.

Proof: Use (5.3) \& (5.12).
Combining everything together so far we arrive at the final result of this section:
(5.19) Theorem. The following subspaces are the same:
(i) $S_{1}=\left\{\gamma \in H_{P}^{2}\left(\Omega_{X}, \mathbb{Q}\right) \mid \Phi_{*}(\gamma)=0\right\}$
(ii) $S_{2}=\left\{\gamma \in H_{P}^{2}\left(\Omega_{X}, \mathbb{Q}\right) \mid\left(d-N_{0}\right) \gamma+i(\gamma)=0\right\}$
(iii) $S_{3}=(i+119 \cdot I) H_{P}^{2}\left(\Omega_{X}, \mathbb{Q}\right)$.

Proof: $S_{1}=S_{2}$ follows immediately from (5.18) and (5.5). Next (3.11), (5.14), (5.17) imply $S_{3} \subset S_{1}$. We first justify the claim: $\{\operatorname{ker}(i+119 \cdot I)\}$ $\cap S_{1}=0$. If $\left.\gamma \in \operatorname{ker}(i+119 \cdot I)\right\} \cap S_{1}$, then $i(\gamma)+119 \gamma=\left(d-N_{0}\right) \gamma+$ $i(\gamma)=0$, hence $\left(119-\left(d-N_{0}\right)\right) \gamma=0, \Rightarrow \gamma=0$ by (4.5), which proves the claim. Using the claim, it is clear that the homomorphism $(i+119 \cdot I)$ : $S_{1} \rightarrow S_{3}$ is injective, hence an isomorphism as $S_{3} \subset S_{1}$. (5.19) now follows.

## §6. A quadratic relation and the proof of the main theorem

We now attend to the proof of the main theorem ((0.6)). Let $r=d-N_{0}$, and set $Q(i)=(r I+i)(i+119 \cdot I)=i^{2}+(119+r) i+r \cdot 119 \cdot I$. We prove:
(6.1) Proposition:
(i) $Q(i): H_{P}^{2}\left(\Omega_{X}, \mathbb{Q}\right) \rightarrow H_{P}^{2}\left(\Omega_{X}, \mathbb{Q}\right)$ is the zero morphism.
(ii) i: $H_{P}^{2}\left(\Omega_{X}, \mathbb{Q}\right) \rightarrow H_{P}^{2}\left(\Omega_{X}, \mathbb{Q}\right)$ is an isomorphism.

Proof: Part (i) is an immediate consequence of (5.19). For part (ii), note that $i(\gamma)=Q(i)(\gamma)=0 \Rightarrow r \cdot 199 \gamma=0$, afortiori $\gamma=0$.
Q.E.D.

Note that for any $\gamma \in H_{A}^{1,1}\left(\Omega_{X}, \mathbb{Q}\right), \Phi_{*}(\gamma)$ has the property that under a horizontal displacement in $\amalg_{v \in \Delta} H^{4}\left(X_{v}, \mathbb{Q}\right), \Phi_{*}(\gamma)$ is still algebraic. One concludes from the proof of (5.5) that $\Phi_{*}(\gamma) \in \mathbb{Q} \omega \wedge \omega$. Therefore $\Phi_{*}\left(H_{A}^{1.1}\left(\Omega_{X}, \mathbb{Q}\right)\right)=\mathbb{Q} \omega \wedge \omega$, hence:
(6.2) $\operatorname{Corollary:~} \Phi_{*}\left(H_{P}^{2}\left(\Omega_{X}, \mathbb{Q}\right)\right)=\operatorname{Prim}^{4}(X, \mathbb{Q})$.

Proof: Use the above remark, (5.5)\&(5.14).
Combining (6.2) with (5.19)\&(6.1), we arrive at our main result.
(6.3) Theorem:
(i) $i$ respects the decomposition $H^{2}\left(\Omega_{X}, \mathbb{Q}\right)=H_{P}^{2}\left(\Omega_{X}, \mathbb{Q}\right) \oplus$ $H_{A}^{1,1}\left(\Omega_{X}, \mathbb{Q}\right)$, moreover $i: H_{P}^{2}\left(\Omega_{X}, \mathbb{Q}\right) \rightarrow H_{P}^{2}\left(\Omega_{X}, \mathbb{Q}\right)$ is an isomorphism.
(ii) There is a s.e.s.:

$$
\begin{gathered}
0 \rightarrow(i+119 \cdot I) H_{P}^{2}\left(\Omega_{X}, \mathbb{Q}\right) \rightarrow H_{P}^{2}\left(\Omega_{X}, \mathbb{Q}\right) \\
\xrightarrow{\Phi_{*}} \operatorname{Prim}^{4}(X, \mathbb{Q}) \rightarrow 0 . \\
(i i i) \quad \Phi_{*}\left(H_{A}^{1,1}\left(\Omega_{X}, \mathbb{Q}\right)\right)=\mathbb{Q} \omega \wedge \omega .
\end{gathered}
$$

(6.4) Corollary: The diagram below:

$$
\begin{aligned}
& \mathrm{H}_{\mathrm{P}}^{2}\left(\Omega_{\mathrm{x}}, \mathbb{Q}\right) \xrightarrow{\Phi_{*}} \operatorname{Prim}^{4}(\mathrm{X}, \mathbb{Q}) \\
& i \downarrow \\
& \downarrow \times 119 \\
& \mathrm{H}^{2}\left(\Omega_{\mathrm{X}}, \mathbb{Q}\right) \xrightarrow{\Phi_{*}} \operatorname{Prim}^{4}(\mathrm{X}, \mathbb{Q})
\end{aligned}
$$

is sign commutative.

Proof: Let $\gamma \in H_{P}^{2}\left(\Omega_{X}, \mathbb{Q}\right)$. Then $(i+119 \cdot I) \gamma \in \operatorname{ker} \Phi_{*}$, hence $\Phi_{*}(i \gamma)$ $+119 \Phi_{*}(\gamma)=0$, which proves (6.4).
