NOTE ON CATEGORIES OF INDECOMPOSABLE MODULES

by Manabu HARADA

Let R be a ring with identity and M a unitary right R-module wich is a directsum of indecomposable, injective modules. E. Matlis [13] posed the following question : for any direct summand L of M, is L also a directsum of indecomposable injective modules ? Recently, U.S. Kahlon [9] and K. Yamagata [16] studied this problem under an assumption that the singular submodule of L is equal to zero.

In this short note, we shall show that if the singular submodule of L is equal to zero, then the affirmative answer of Matlis' problem is an immediate consequence from [6] and [10]. Especially, in the section 4, we shall give simpler proofs of generalized Kahlon' results [9]. In sections 2 and 3, we shall give some supplementary results of [7] and [8].

I. DEFINITIONS

Let R be a ring with identity. We assume that all modules in this note are unitary right R-modules. Let M be an R-module. If $\operatorname{End}_{R}(M) = S_{M}$ is a local ring (the Jacobson radical is a unique maximal ideal among left an right ideals), Mis called *completely indecomposable*.

Let \mathscr{K} be the induced full sub-category from all completely indecomposable modules M_{α} in the category of right *R*-modules \mathscr{M}_{R} , namely every object in \mathscr{K} is a direct sum of some family of $\{M_{\alpha}\}$ (see [6],§ 3). Let M^{1} , M^{2} be objects in \mathscr{K} and $M = \sum_{I} \mathfrak{K} \mathfrak{M}_{\alpha}^{i}$; $M_{\alpha}^{i} \in \{M_{\alpha}\}$. We put $[M^{1}, M^{2}] \cap \mathfrak{I}' = \{f \mid \in \operatorname{Hom}_{R}(M^{1}, M^{2}), p_{\beta}f_{\beta}^{i} : M_{\beta}^{i} + M_{\beta}^{i}$ is non-isomorphic for all $\beta \in I^{1}$, $\beta' \in I^{2}$, where i_{β}^{1} , $: M_{\beta}^{1}$, $\neq M^{1}$ is the injection and $p_{\beta}^{2}: M^{2} \neq M_{\beta}^{2}$ is the projection}. Then \mathcal{J}' is an ideal in \mathcal{A} and \mathcal{A}/\mathcal{J}' is a completely reducible C_{3} -abelian category by [6], Theorem 7. If $M^{1} = M^{2}$, we denote $[M^{1}, M^{1}] \cap \mathcal{J}'$ by \mathcal{J}' .

Let A and f be an object and a morphism in \mathscr{K} , respectively. By \overline{A} and \overline{f} we denote the residue classes of A and f in \mathscr{A}/\mathscr{I} '. Let $A \supset B$ be in \mathscr{K} and i the inclusion of B to A. If \overline{i} is isomorphic in \mathscr{K}/\mathscr{I} ', we say B is a *dense submodule* of A (see [7], p. 310-311). We assume $A = C \oplus D$ as R-modules and let e the projection of A onto C. By \overline{C} we denote Im \overline{e} in \mathscr{K}/\mathscr{I} ', even though C is not in \mathscr{A} . Next, we assume that $A \supset B$ are in \mathscr{K} and $B = \sum_{K} \oplus T_{\alpha}$ as R-modules. If $\sum_{K} \oplus T_{\alpha}'$ is a direct summand of A for any finite subset K' of K, then we say that B is a *finitely direct summand* of A (with respect to the decomposition $\sum_{K} \oplus T_{\alpha}$). It is clear that every directsum of injective K modules is a finitely direct summand of its extension module.

We summarize here definitions of the exchange property given in [6], [7], [8] and [10].

Let $\{M_{\alpha}\}_{I}$ and $\{N_{\beta}\}_{J}$ be sets of completely indecomposable modules. We put $M = \sum_{T} \bigoplus M_{\alpha}$ we recall Condition II given in [6], §3.

II (Take out). For any subset I' of I and any other decomposition $M = \sum_{J} \Theta N_{\beta}, \text{ there exists a subset } \{N_{\phi(\gamma)}\}_{\gamma \in I'}, \text{ of } \{N_{\beta}\}_{J} \text{ such that } M_{\widehat{\gamma}} N_{\phi(\gamma)}$ for all $\gamma \in I'$ and $M = \sum_{I'} \Theta N_{\phi(\gamma)} \oplus \sum_{\alpha \in I-I'} \Theta M.$

II' (Put in). For the same assumption as above, there exists a subset $\{N_{\psi(\gamma)}\}_{\gamma \in I}$, such that $M_{\gamma} \approx N_{\psi(\gamma)}$ for all $\gamma \in I'$ and $M = \sum_{\alpha \in I} \Phi M_{\alpha} \oplus \Sigma \oplus N_{\beta \in J - \psi(I')} B$ where ϕ and ψ are one-to-one mappings of I' into J.

If we replace the subset I' by I-I', then II and II' are equivalent by Azumaya's theorem [1]. Furthermore, Azumaya [1] showed that II and II' are satisfied for any finite subset I' of I.

We remark that if a given decomposition $M = \sum_{I} \bigoplus M_{\alpha}$ satisfies II or II', then any decomposition $M = \sum_{J} \bigoplus N_{\beta}$ does the same property. Because, let $M = \sum_{K} \bigoplus T_{\delta}$ be another decomposition with T_{δ} indecomposable. Then there exists an automorphism σ of M such that $\sigma(N_{\beta}) = M_{\pi(\beta)}$ by Azumaya's theorem, where π is a one-to-one mapping of J to I. We apply II or II' for the decompositions $M = \sum_{K} \bigoplus M_{\pi(\beta)} = \sum_{K} \bigoplus \sigma(T_{\delta})$. Then we have $M = \sum_{Y \in J'} \bigoplus \sigma(T_{\phi(Y)}) \bigoplus \sum_{K \in J-J'} \bigoplus M_{\pi(\beta)}$ or $M = \sum_{K} \bigoplus \sigma(T_{\delta})$. Then we have $M = \sum_{Y \in J'} \bigoplus \sigma(T_{\phi(Y)}) \bigoplus \sum_{K \in J-J'} \bigoplus M_{\pi(\beta)}$ $\bigoplus_{K} \sum_{K \in K-\psi(J')} \bigoplus \sigma(T_{\delta})$. Hence, $M = \sigma^{-1}(M) = \bigoplus_{J'} \bigoplus \sigma(Y) \bigoplus_{K \in J-J'} \bigoplus M_{K}(\beta)$ $\bigoplus_{K \in K-\psi(J')} \max_{K} \max_{K \in K-\psi(J')} \bigoplus_{K \in K-\psi(J')} \max_{K \in K-\psi(K,K)} \max_{K$

We note II and II are independent for fixed two decompositions $M = \sum_{I} \oplus M_{\alpha} = \sum_{J} \oplus N_{\beta} \text{ and a given subset } I' \text{ of } I. \text{ For example, we assume there}$ exist non-isomorphic monomorphisms $f_i \text{ of } M_i \text{ to } M_{i+1}$ for all $i \in K \subseteq I$. We put $M'_i = \{m_i + f_i(m_i) \mid \in M_I \oplus M_{i+1}, m_i \in M_i\}$. Then $M = M'_1 \oplus M_2 \oplus M'_3 \oplus \ldots \oplus M_o =$ $M_1 \oplus M'_2 \oplus M_3 \oplus M'_4 \oplus \ldots \oplus M_o$, where $M_o = \sum_{\alpha \in I - K} \oplus M_{\alpha}$. It is clear that $n' = M'_1 \oplus M'_2 \oplus \ldots \oplus M_o$ has the property II for the second decomposition in the above. However, by the proof of [6], Lemma 9 we know that if N had the property II', then $\{f_i\}$ would be a locally semi-T-nilpotent system (see (see [7], § 1 for the definition). Similarly, $N = M_1 \oplus M_3 \oplus \ldots \oplus M_o$ has the property II' for the first decomposition, however if N had the property II, then $\{f_i\}$ would be a locally semi-T-nilpotent system.

We say that a direct summand T of M has the exchange property in M if for any decomposition $M = \sum_{I} \bigoplus U_{\delta} (U_{\delta} \text{ are not necessarily indecomposable}),$ $M = T \oplus \Sigma \oplus U_{\delta}'$ and $U_{\delta} \supseteq U_{\delta}'$ for all δJ . Especially, if T has the above property, whenever all U_{δ} are indecomposable, we say T has the exchange property in M for indecomposable modules. We refer the reader for terminologies to [6] and [7].

2. DIRECT SUMMANDS

First we recall somme of main theorems in [7] and [10].

THEOREM 1 ([7],[10]). - Let M be a direct sum of a family of completely indecomposable modules $\{M_{\alpha}\}_{I}$. Then the following statements are equivalent.

1) M satisfies the property of "take out"

2) Every direct summand of M has the exchange property in M

3) Every direct summand of M has the exchange property in M for indecomposable modules

4) $\{M_{\alpha}\}_{T}$ is a locally semi-T-nilpotent system

5) \mathcal{J} ' is the Jacobson radical \mathcal{J} of $S = \operatorname{End}_{R}(M)$

6) Every finitely direct summand M' of M such that $M' = \sum_{K} \bigoplus_{K} T_{\alpha}$ is a direct summand of M for any [K] and any family $\{T_{\alpha}\}$

6') 6) is valid for any K with $K = \aleph_0$, and

7) 6') is valid whenever all T_{α} are completely indecomposable, 8) S/ is a regular ring (and self injective as a one sided module) and every idempotents in S/J are lifted to S, where |K| is the cardinal number of K.

14

Proof. 2) \longleftrightarrow 4) is proved by [8], Corollary to Proposition 1. We note 1), 4) in § 1. 2) \longrightarrow 3) \longrightarrow 1) is clear. 4) \longleftrightarrow 5) is proved by [10], Theorem. 6) \rightarrow 6') \rightarrow 7) is trivial. 7) \rightarrow 4). Let $\{M_{\alpha i}\}_{1}^{\infty}$ be any countable sub-family of $\{M_{\alpha}\}_{T}$ and let $\{f_{i}\}_{1}^{\infty}$ be a family of non-isomorphisms $f_{i}: M_{i} = M_{\alpha i} \rightarrow M_{i+1} = M_{\alpha i}$ $M_{\alpha i+1}$. Put $M' = \sum_{1}^{\infty} \bigoplus M'_{i}$, where $M'_{i} = \{m_{i}+f_{i}(m_{i}) | \in M, m_{i} \in M_{i}\}$. Since $\sum_{i=1}^{n} \oplus M_{i}^{\prime} \oplus M_{n+1} = \sum_{i=1}^{n+1} \oplus M_{i}^{\prime}, M^{\prime} \text{ is a finitely direct summand of } M. \text{ Hence }, M^{\prime}$ is direct summand of $\sum_{\tau} \oplus M_{i}$ (= M_{o}) $\leq M$ by 7). We know from [8], Theorem 2 that M' is a dense submodule of M_o . Therefore, $M' = M_o$ by [6], lemma 7, which means that $\{M_i\}_{1}^{\infty}$ is a locally semi-T-nilpotent (cf. [6], the proof of Lemma 9). from 2) that all T_{α} are indecomposable. Now, we consider the above modules in \mathscr{A} /1 '. Let *i* be the inclusion of *M*' to *M*. Since *M*' is a finitely direct summand of M and \mathcal{A}/\mathcal{I} ' is a C₃-abelian, \overline{i} is the inclusion of \overline{M} ' into \overline{M} and $\overline{M}' = \sum_{V} \oplus \overline{T}_{\alpha}$. Then \overline{M}' is a coretract of \overline{M} by [6], Theorem 7. $\{T_{\alpha}\}_{K}$ is a locally semi-T-nilpotent system. Therefore, i is a coretract of M by 5) (cf. [7], the proof of Proposition 2). 5) \leftrightarrow 8) It is clear from [6], Lemma ? and 13 Corollary to Lemma 6.

Remark 1. In the above proof of 4) $\longrightarrow 6$) we only make use of a fact that $\{T_{\alpha}\}_{\kappa}$ is a locally semi-T-nilpotent system.

Next, we study a general type of Matlis' problem. The following theorem combines [10] and [14].

THEOREM 2. - Let M be a directsum of completely indecomposable modules M_{α} ; $M_{\alpha} = \sum_{I} \oplus M_{\alpha}$ and $\{M_{\beta}\}_{J}$ the sub-family of countably generated R-modules M_{β} of $\{M_{\alpha}\}_{I}$. We assume $\{M_{\gamma}\}_{I-J}$ is a locally semi-T-nilpotent system. Then every direct summand of M is in St. Proof. Let $M = N_1 \oplus N_2$ and K = I-J. Each N_i contains a dense submodule $T_i = \sum_{L_i} \oplus M'_{\gamma i}$ such that $M \approx T_1 \oplus T_2$ by [6], Theorem 1 for i = 1, 2, where $M'_{\gamma i}$ is isomorphic to some M_α ; $\alpha \in I$. We divide L_i into two partitions $L_i = J_i \cup K_i$ such that for $\gamma_i \in J_i$ (resp. K_i) $M'_{\gamma i}$ is isomorphic to some $M_\alpha; \alpha \in J$ (resp. K). Since $\{M'_{\gamma i}\}_{K_i}$ is locally semi-T-nilpotent, $T'_i = \sum_{K_i} \oplus M'_{\gamma i}$ is a direct summand of N_i by Remark 1 and [7], proposition 2, say $N_i = T'_i \oplus N'_i$ Furthermore, $T'_1 \oplus T'_2$ has the exchange property in M by [7], Theorem 2. Hence, $N'_1 \oplus N'_2 \approx \sum_{J'} \oplus M_\beta \oplus \sum_{K'} \oplus M_{\gamma'}$. We consider those modules in \mathfrak{M}/\mathcal{J} '. Then $\tilde{M} = \tilde{T}'_1 \oplus \tilde{T}'_2 \oplus \sum_{J'} \oplus \tilde{M}'_{\gamma i} \oplus \sum_{K'} \oplus \tilde{M}'_{\gamma i}$ on the other hand, $\tilde{M} = \tilde{N}_1 \oplus \tilde{N}_2$ $= \tilde{T}'_1 \oplus \tilde{N}'_1 \oplus \tilde{T}'_2 \oplus \tilde{N}'_2^{-1} = \tilde{T}'_1 \oplus \tilde{T}'_2 \oplus \sum_{J'} \oplus \tilde{M}'_{\beta} \oplus \sum_{K'} \oplus \tilde{M}'_{\gamma}$. Since all $M'_{\gamma i}$ in the left side are $\sum_{J_1} \oplus \tilde{M}'_{\gamma i} \oplus \sum_{J_2} \oplus \tilde{M}'_{\gamma i} \approx \sum_{J'} \oplus \tilde{M}'_{\beta} \oplus \sum_{K'} \oplus \tilde{M}'_{\gamma}$. Since all $M'_{\gamma i}$ in the left side are countably generated, $K' = \emptyset$ by [6], Theorem 7. Therefore, N'_i is in \mathfrak{M} by [14] or [7], Proposition 3. We have completed the proof.

In Theorem 2 if N_1 is injective, NN_1 is in \mathcal{H} by [4], [9] or [15] without any assumption. Similarly

PROPOSITION 1. - Let M be in \mathcal{A} and N a direct summand of M. If N is projective, N is in \mathcal{A} .

Proof. By [11], Theorem 1, N is a direct sum of countably generated R-submodules P_{α} . Furthermore, P_{α} is in \mathcal{A} by [7], Proposition 3. Hence, N is in \mathcal{A} .

The following corollary was given with an assumption that J(P) is small in P by [12], Theorem 5.5 and [7], Proposition 5.

COROLLARY. - Let M be in A and R-projective. Then every direct summand P of M is in \mathcal{A} .

It is also clear.

We give a property of dense submodules.

PROPOSITION 2. - Let M be in A and N a direct summand of M. Then there exists a submodule N' of satisfying the following properties : 1) N' is in A, 2) N' is a finitely direct summand of N and 3) If T = $\sum \bigoplus T_{\alpha}$ is finitely direct summand of N, T is isomorphic to a direct summand of N', where T_{α} 's are indecomposable. Especially, every countable generated R-submodule of N is isomorphic to a submodule of N'. Every submodule N'' of N satisfying 1) and 2) is isomorphic to a direct summand of any dense submodule of N.

Proof. Let N' be a dense submodule of N. Then N' satisfies 1) and 2) by [7], Proposition 2. Let e and e_{α} be projections of M to N and T_{α} with respect to given decompositions. Then $ee_{\alpha} = e_{\alpha}$ for all $\alpha \in J$. We consider those modules in \mathcal{A}/\mathcal{J} . Since T is a finitely direct summand of $N(\subseteq M)$, $\overline{T} = \sum_{J} \oplus \overline{T}_{\alpha} \subseteq Im \ \overline{e} = \overline{N'}$. Hence, T is isomorphic to a direct summand of N' by [6], Theorem 7. We easily see that for two finitely generated submodules $T_1 \supseteq T_2$ in N, we can find a direct summand T'_i of N such that $T'_i \supseteq T'_i$, $T'_1 \supseteq T'_2$ and T'_i is a finite directsum of indecomposable modules for i = 1, 2 (cf. [7], the proof of Proposition 3). Since $T'_1 \supseteq T'_2$, we can find a monomorphism of T_1 to N' which is an extension of a given monomorphism of T_2 to N' by [6], Theorem 7.

17

Hence, every countably generated R-submodule of N is isomorphic to a submodule of N' by the standard argument. Let N'' be a submodule satisfying 1) and 2). Then $\bar{N}' \leq \bar{N}'$. Hence, the last statement is clear from [6], theorem 7.

3. EXCHANGE PROPERTY

It seems to the author that the difficulty of the exchange property in M comes from the following facts. Let M be in \mathscr{A} and $M = N_1 \oplus N_2 \oplus N_3$ as R-modules. It is well known from [2] that if N_1 and N_2 have the exchange property in M, then so is $N_1 \oplus N_2$, however the converse is not true. Furthermore, even if neither N_1 nor N_2 has the exchange property in M, it is possible that $N_1 \oplus N_2$ does.

We note that if a direct summand L of M has the exchange property, then L is in \mathcal{A} . The following theorem is a slight generalization of some parts in Theorem 1.

THEOREM 3. - Let M be in \mathcal{A} and $M = N_1 \oplus N_2$. Let f be the projection of M Onto N_1 . Then $f \mathcal{J}' f = f \mathcal{J} f$ if and only if every direct summand of N_1 has the exchange property in M. In the case N_2 also has the exchange property in M, where \mathcal{J}' is the ideal defined in §1 and \mathcal{J} is the Jacobson radical of $S = \operatorname{End}_{p}(M)$.

Proof. "Only if". Let $M = \sum_{I} \bigoplus M_{\alpha}$ and M'_{α} 's are completely indecomposable. We can find a subset J of I such that $\overline{M}_{J} = \sum_{J} \bigoplus \overline{M}_{\alpha} \approx \operatorname{Im} \overline{f}$ in \mathcal{A}/J' by [6], Theorem 7. Let e be the projection of M to M_{J} . Then $fS/fJ' \approx eS/eJ'$. Hence, there exist $a \in eSf$, $b \in fSe$ such that $ba \equiv f \pmod{3'}$. Put $f-ba = n \in \mathbf{J'}$, then $n \in f \notin f = f \notin f$, which tis the radical of $S_{N_1} = \operatorname{End}_R(N_1)$. Hence, bais an automorphism of fS as an S-module. Therefore, $eS = f_1S \oplus f_2S$ and $f_1S \stackrel{2}{\Rightarrow} fS$, $f_2S = \operatorname{Ker} b$ and $f_i^2 = f_i$. Since b induces $eS/e \notin f \approx fS/f \notin f$, $f_2S = f_2 \notin f \in \mathcal{J'}$. Hence, $f_2 = 0$ by [1], Theorem 1 or [6], Lemma 7 and $eS \approx fS$, which implies $N_1 \approx M_J$. Therefore, $\{M_{\alpha}\}_J$ is a locally semi-T-nilpotent system by Theorem 1. Thus, we have poved "only if" from [8], Corollary to Theorem 2. "if". $N_1 = \sum_K \oplus M_Y'$ and $\{M_Y'\}$ is a locally semi-T-nilpotent system. by [8], Corollary to Theorem 2. Hence, $f \notin f = f \notin f$ by Theorem 1 and [6], Lemma 5. The remaining part is clear from [8], Theorem 2.

COROLLARY . - Let M and N₁ be as above. If for every monomorphism g in S_{N_1} . Im g is a direct summand of N (i.e. $gS_{N_1} = eS_{N_1}$, $e^2 = e$), then N₂ and every direct summand of N₁ have the exchange property in M. eEspecially, if N₁ is quasi-injective, N_i has the exchange property in M for i = 1, 2, (cf. [4]).

Proof. Let $M = N_1 \oplus N_2$ and f be the projection of M to N_1 . We take any element α in fJ'f. Then Ker $(1-\alpha) = C$ by [1], Theorem 2 and Im $(1-\alpha) =$ $Im((1-\alpha)|N_1) \oplus N_2$. Since Im $((1-\alpha)|N_1)$ is a direct summand of N_1 by the assumption, $Im(1-\alpha)$ is a direct summand of M. On the other hand, $Im(1-\alpha)$ is a dense submodule of M by [7], Theorem 2 and hence, $M = Im(1-\alpha)$. Therefore, $f-\alpha$ is an automorphism of N_1 , which implies fJ'f = fJf. Hence, N_1 has the exchange property by the theorem. The remaining part of the corollary is immediate from the above. In Theorem 4 below, we shall show the converse of Corollary in a special case.

Remark 2.[6], Proposition 10 and [9], Theorem I are special cases of Corollary I.

It is shown in [8], Remark in p. 52 that the exchange property does not imply the locally semi-T-nilpotency. In a special case we have

PROPOSITION 3. Let $\{M_i\}^{\infty}$, be a set of completely indecomposable modules such that M_i is monomorphic, but not isomorphic to M_{i+1} (cf. [6], p. 340 and [8], Corollary 3). 1) Let $M = \sum_{i=1}^{\infty} \oplus M_i = N_1 \oplus N_2$. Then N_1 has the exchange property in M if and only if either N_1 or N_2 is a directsum of indecomposable modules $\{M_i^{\prime}\}$ which is a semi-T-nilpotent system, (in this case, a finite directsum of M_i^{\prime}). 2) We further assume that each M_i itself is a locally T-nilpotent system and $M = \Sigma \oplus M'_{\alpha}$; $M'_{\alpha} \approx M_i$ for some i and $M = N_1 \oplus N_2$. Then we have the same statement in 1).

Proof. 1) "If part" is clear from [8], Theorem 2. We assume that N_1 has the exchange property. Then N_i is in \mathscr{A} : say $N_i = \sum_{K \in J^i} \oplus T_k^i$, where $T_k^i \gtrsim M_m$ for some m. if J^i vere infjinte for i = 1, 2, we vould have a contradiction from the assumption and [8], Lemma 2. 2) We can prove it similarly to 1).

PROPOSITION 4. - Let $M = \sum_{I} \bigoplus M_{\alpha}$ and M_{α} be isomorphic to a completely indecomposable module M_{1} for all $\alpha \in I$. Let $M = N_{1} \oplus N_{2}$. Then N_{1} has the exchange property in M if and only if M itself is a locally T-nilpotent system or either N_{1} or N_{2} is isomorphic to a finite directsum of M_{1} . Proof. It is clear from [8], Lemma 2.

COROLLARY. - Let P be a completely indecomposable and projective module and $M = \sum_{I} \bigoplus P_{\alpha}$; $P_{\alpha} \approx P$. Let $M = N_{1} \bigoplus N_{2}$. Then N_{1} has the exchange property in M if and only if either N_{1} or N_{2} is semi-perfect or equivalentely $J(N_{2})$ is small in N_{T} for i = 1 or 2.

Proof. It is clear from Proposition 4 and [7], Theorem 7.

4. MODULES WITH ZERO SINGULAR SUBMODULES.

In this section, we study Matlis' problem and give simpler proofs of slightly generalized results of [9], Theorems 2 and 3.

Let N be an R-module. We denote the singular submodule of N by Z(N), namely $Z(N) = \{n | \in N, (o:n) \text{ is large in } R\}$. The following lemma is well known and essential in this section.

LEMMA. - Let $\{N_{\alpha}\}_{I}$ be a set of indecomposable injective modules. If $Z(N_{\alpha},) = 0$ any homomorphism of N_{α} to N_{α} , is either isomorphic or zero. Especially, if $Z(N_{\alpha}) = 0$ for all $\alpha \in I$, $\{N_{\alpha}\}$ is a locally T-nilpotent system.

Let *M* be in \mathcal{A} and $M = N_1 \oplus N_2$. Then we note that N_1 always contains direct summands which are finite directsums of indecomposable modules (cf. [6], Corollary 1 in p. 334).

PROPOSITION 5. – Let M be in \mathcal{A} and $M = N_1 \oplus N_2$. We assume that for any decomposable direct summand T_1, T_2 of N_1 non-zero elements in $\operatorname{Hom}_R(T_1, T_2)$ are always isomorphic. Then N_i is in \mathcal{A} for i = 1, 2. Proof. Let $\Sigma \oplus T_{\beta}$ be a dense submodule of N_1 , where T_{β} 's are indecomposable. Every T_{β} is a direct summand of N_1 by [6], Proposition 2. Hence $\{T_{\beta}\}_J$ is a locally T-nilpotent system by the assumption. Therefore, $N_1 = \sum_J \oplus T_{\beta}$ and N_2 is in \mathcal{A} by Remark 1, [7], Proposition 2 and [8], Theorem 2.

COROLLARY. - ([16], Theorem 4).Let $\{M_{\alpha}\}_{I}$ be a family of indecomposable injective modules and $M = \sum_{I} \oplus M_{\alpha}$. If $M = N_{I} \oplus N_{2}$ and $Z(N_{I}) = 0$, then N_{i} is in \mathcal{A} for i = 1, 2 (cf. [9], Theorem 3).

Proof. It is clear from Lemma and Proposition 5.

THEOREM 4. - Let $\{E_{\alpha}\}_{I}$ be a family of injective and indecomposable modules and $E = \sum_{I} \oplus E_{\alpha}$. Then the following statements are equivalent. 1) $\{E_{\alpha}\}_{I}$ is a locally semi-T-nilpotent system 2) Any extension module M, in A, of E contains E as a direct summand 3) There are no proper and essential extensions, in A, of E and 4) Im g is a direct summand of E for any monomorphism g in S_{E} .

Proof. 4) \longrightarrow 1) is proved by Theorem 1 and Corollary 1 to Theorem 3. 1) \longrightarrow 4) by the assumption and Theorem 1 Im $g = \sum_{K} \oplus E_{\beta}$; $E'_{\beta} \approx E_{\alpha}$ for some α . Since E'_{β} is injective, Im g is a finitely direct summand of M. On the other hand, $\{E'_{\beta}\}_{K}$ is a locally semi-T-nilpotent system by Theorem 1. Hence, Im g is a direct summand of M from Remark 1. 1) \longrightarrow 2) is clear from Theorem 1. 2) \longrightarrow 3) is trivial. 3) \longrightarrow 1) We assume that $\{E_{\alpha}\}_{I}$ is not locally semi-T-nilpotent. Then we have a sub-family $\{E_i\}_{1}^{\infty}$ of $\{E_{\alpha}\}_{I}$ such that there exist non-isomorphisms $f_i:E_i \longrightarrow E_{i+1}$ and an element x in E with a property : $f_n f_{n-1} \cdots f_1(x) \neq 0$ for all n. We note Ker $f_i \neq 0$ for all i, since E_i is injective an indecomposable. Put $E'_i = \{x_i + f_i(x_i) | \in E_i \oplus E_{i+1}\} \in \sum_{l=1}^{\infty} \oplus E_j$ and $E = \sum_{l=1}^{n} \oplus E_j \oplus E_o$. Then $E_i \cap (\sum_{j=1}^{n} \oplus E'_j) \geq \text{Ker } f_i \neq 0$. Hence, $\sum_{j=1}^{n} \oplus E'_j \oplus E_o$ is essential in E. It is clear $x \in E - (\sum_{j=1}^{n} \oplus E'_j \oplus E_o)$. Let E^* be an injective hull of E. Then we can extend an isomorphism ϕ of $\sum_{j=1}^{n} \oplus E'_j \oplus E_o$ onto E to a monomorphism of E^* . Hence $\phi(\sum_{j=1}^{n} \oplus E'_j \oplus E_o) = E \notin \phi(E) = \sum_{j=1}^{n} \oplus \phi(E_\alpha) \in \mathscr{A}$.

COROLLARY 1. – We assume further in Theorem 4 that all E_{α} are noetherian. Then we obtain all of 1) \sim 4) in Theorem 4.

Proof. Let E_1, E_2 and E_3 be injective, indecomposable and noetherian modules, and $f_i: E_i \longrightarrow E_{i+1}$ non-isomorphisme. Then Ker $f_i \neq 0$ and Im $f_1 \cap \text{Ker } f_2 \neq 0$ if $f_1 \neq 0$, since E_2 is uniform. Hence, Ker $f_1 \subseteq \text{Ker } f_2 f_1$ if $f_1 \neq 0$. Therefore, $\{E_{\alpha}\}_T$ is a T-nilpotent system.

COROLLARY 2. Let M be in \mathcal{A} and L a submodule of M. We assume that Z(L) = 0and L is a direct sum of injective modules. Then L is a direct summand of M (cf. [9], Theorem 2).

Proof. Since every injective submodule of M is in \mathscr{A} by Corollary to Theorem 3. L is a direct summand of M by Lemma and Theorem 4.

Remark 3. Let $\{E_{\alpha}\}_{T}$ be a family of indecomposable, injective modules. In

general, $\{E_{\alpha}\}_{I}$ is not locally semi-T-nilpotent and hence, $\sum_{I} \oplus E_{\alpha}$ is not quasiinjective. Furthermore, even if all E_{α} is not injective. If either $E = \sum_{I} \oplus E_{\alpha}$ is (quasi-)injective or Z(E) = 0, $\{E_{\alpha}\}_{I}$ is a locally semi-T-nilpotent system. However, the converse is not true as follows. Let K be a commutative, local Frobenius ring with $Z(K) \neq 0, M_{2I} = \sum_{i=1}^{\infty} \oplus K_{i}$; $K_{i} \approx K, M_{32} = \operatorname{Hom}_{K} (M_{2I}, K) = \pi K_{i}$ and $M_{3I} = K$. Then

$$R = \begin{pmatrix} K & O \\ M_{21} & K \\ M_{31} & M_{32} & K \end{pmatrix} = T(K_{s}K_{s}K_{j}M_{ij})$$

is a ring (cf. [5], p. 23). Put $e_1 = T(1,0,0;0)$ and $e_3 = T(0,0,1;0)$, then $\operatorname{Hom}_{K}(Re_1,K) \approx e_3R$ is *R*-injective. Since $e_3Re_3 = K$ is local, e_3R is indecomposable and e_3R itself is a T-nilpotent system. It is clear that $Z(e_3R) \supseteq$ $(Z(K),0,0) \neq 0$. Put $S_i = (M_{31}, \prod_{j=i}^{m} K_j, K) \subseteq e_3R$. Then $(0:S_1)_R \subseteq (0:S_j)_R$ if i < j. Hence, $\sum_{i=1}^{\infty} \oplus e_3R$ is not injective by [3]. However, I do not know whether $\sum_{i=1}^{\infty} \oplus e_3R$ is quasi-injective or not. If we can construct a self-injective and perfect, but not Σ -injective ring S (or a self-injective and local, but not Σ -injective ring with Z(S) = 0), then $\Sigma \oplus S$ is not quasi-injective but $\{S\}_I$ is a T-nil-I
